Part I

Introduction

1 Usage

This package is called tikz-ext, however, one can't load it via $\scalebox{ usepackage.}^1$ Instead, this package consists mostly of PGF and $\scalebox{ Ti}kZ$ libraries which are loaded by either $\scalebox{ usepqflibrary or }$

2 Why do we need it?

Since I have been answering questions on TeX.sx I've noticed that some questions come up again and again, every time with a slightly different approach on how to solve them.

I don't like reinventing the wheel which is why I've gathered the solutions of my answers in this package.

3 Having problems?

Note however, that most of these extensions haven't been stress-tested properly and might be considered experimental.

Don't hesitate to open an issue on GitHub. You probably found a bug.

4 Namespaces and TikZ-Extensions macros

Since some parts of this package have existed in some form since 2013, the choice for key names and in which PGFkeys namespace they reside is not always optimal. They often reside in the main /tikz or /pqf path. Similar applies to macro names.

For future versions, it is planned to move those in the /tikz/ext namespace. For keys in the /pgf namespace, this will probably not happen since it makes it not very intuitive to use them in TikZ.

Starting from version 0.6, TikZ-Extensions provides commands that return the current version for compatibility testing. The second simply increments with every release so that the first doesn't need to be parsed.

\tikzextversion

Returns 0.6.

\tikzextversionnumber

Returns 8.

Also starting from version 0.6, there's \tikzextset.

\tikzextset{\langle options\rangle}

This command will process the $\langle options \rangle$ using the \pgfkeys command with the default path set to $\protect\prote$

¹Except for pgfcalendar-ext and pgffor-ext.

5 Compatibility with older versions

As discussed in the previous section, keys and commands of extensions that existed before version 0.6 that do not appear in this manual are considered deprecated.

/tikz/ext/compat=pre 0.6|0.6|warn|newest (default pre 0.6)

This sets the global compatibility setting for every extension of this package (whether already loaded or not).

The choice warn gives out warning for deprecated keys or commands but still executes them if they were not not in use when an extension was loaded.

The following table shows the compatibility settings for each extension. A \checkmark denotes an available setting where \checkmark denotes the default compatibility setting. A – denotes that it is not different than the newest setting.

Extension	pre 0.6	0.6	newest
ext.arrows	✓	-	4
ext.layers	\checkmark	_	\mathscr{A}
ext.nodes	\checkmark	_	\mathscr{A}
ext.scalepicture	\checkmark	_	\mathscr{A}
ext.transformations.mirror	\checkmark	-	\mathscr{A}

For each available extension the compatibility setting can be adjusted as well after the extension is loaded.

For \(\langle version \rangle\) the same choices are valid as for the main compat key. It should be noted that at this point, a compatibility setting can't really be reversed since they only forward arguments from an old key or command to the new version.

The old names are given as a subtitle to the new one in the sections that introduce them.

Part II TikZ Libraries

These libraries only work with TikZ.

6 Arrow Pics

TikZ Library ext.arrows-plus

```
\usetikzlibrary{ext.arrows-plus} % LATEX and plain TEX \usetikzlibrary[ext.arrows-plus] % ConTEXt
```

This library defines pics and keys that can be used to place (bended) arrow tips on paths.

The markings decoration already provides the functionality to place arrow tips along the path. The pics and keys provided by this library serve as an alternative.

Many of the pics and keys share various keys that specify where and how the arrow tips are placed.

```
/\text{tikz/ext/pos} \ll (\text{value}) (no default, initially 0.0)
```

If the pic type supports it and a start arrow tip sequence is provided this specifies the position of that sequence.

```
/\text{tikz/ext/pos} >= \langle value \rangle (no default, initially 0.5)
```

This is an alias for / tikz/pos, if an end arrow tip sequence is provided, it is placed at this position.

```
/tikz/ext/arrow shift mode=⟨shift mode⟩ (no default, initially total length)
```

This key is used to set the $\langle shift\ mode \rangle$ for the arrow tip. It can be one of the following.

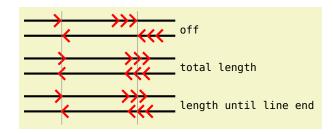

```
arrow shift mode=off This disables the shifting.
```

arrow shift mode=total length The total length of the whole arrow tip sequence will be used.

```
arrow shift mode=total This is an alias for total length.
```

arrow shift mode=length until line end The length of the whole arrow tip until the line end will be used – as reported by PGF which might not always be the expected one.

arrow shift mode=line end This is an alias for length until line end.

```
\usetikzlibrary {ext.arrows-plus}
\begin{tikzpicture} [>={Straight Barb[color=red]}, ultra thick]
\ttfamily
\foreach[count=\y] \shiftmode in {off, total length, length until line end}
\draw[ext/arrow shift mode=\shiftmode] (0, -\y)
-- pic {ext/arrow=>} ++(right:2)
-- pic {ext/arrow=>.>>} ++(right:2) node[below right] {\shiftmode}
++(down:.4) -- pic {ext/arrow=>.>>} ++( left:2)
-- pic {ext/arrow=>} ++( left:2);
\draw[thin, gray] (1,-.75) -- +(down:3) (3,-.75) -- +(down:3);
\end{tikzpicture}
```

For single arrow tips it might be better to use the Centered arrow tip variants of the ext.arrows library (see sec 20) and disabled arrow shift mode.

When an arrow tip sequence is to be drawn depending on the shift mode its total length or its length until the line end will be determined and multiplied with the arrow shift factor. The result of this evaluation is used to shift the arrow tip sequence in the tip's direction.

```
/tikz/ext/arrow shift factor=(value) (no default, initially 0.5)
```

This determines the shift factor.

The default value is probably good for most cases.

6.1 Arrow pic types

This library provides the following pics:

ext/arrow This is the simplest implementation to place an arrow tip along a path. It uses the current timer that is also used to place nodes.

It can be used without any adjustment for every path operation that provides such a timer. These do *not* include circle, ellipse, plot and grid. For rectangle, parabola, sin and cos, the ext.paths.timer library is recommended or even necessary (see section 13).

The arrow tips will never be bended. For this the following pic types or the /tikz/ext/arc arrows key will be necessary.

Due to [1] with an active transformation, the arrow tips won't be placed correctly in many cases. For this *and* bended arrow tips the following pics are necessary.

ext/softpath arrows This pic type places a possible bended arrow tip on the last segment of the path.

For the path operators --, | - and - | this works even with a non-identity transformation. If possible, the current timer will be used to take more segments into account so that the arrow tip can be placed along the recent path operation.

This won't work for arcs, for this the /tikz/ext/arc arrows key will be necessary.

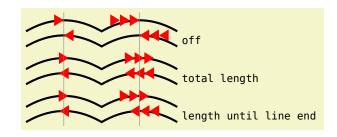

This pic type can place two tip specification, one at pos > and one at pos < in the reversed direction.

ext/softpath arrow This is an alias for softpath arrows with an empty start arrow tip specification.

Pic type ext/arrow=(arrow tip specification)

This pic draws the given $\langle arrow \ tip \ specification \rangle$ (defaults to the end tip specification of the path).

This obviously is best use as a pic along a path segment that supports it. It *does not* support bended arrow tips.

 $\textbf{Pic type ext/softpath arrows=} \langle \textit{start tip specification} \rangle \cdot \langle \textit{end tip specification} \rangle$

This pic draws the given arrow tip specification (defaults to the already present tip specification of the path) along the previous path segment (a curve or a line). It supports the pos < key.

Note: For arcs with an angle greater than 90° this will not work as expected. Use the arc arrows key instead.

Pic type softpath arrow=\(\langle end tip specification\)

This pic type is an alias for softpath arrows = $-\langle end\ tip\ specification \rangle$.

6.2 Arrow keys

The last pic type softpath arrows is also available as a key which is the preferred version.

```
/tikz/ext/softpath arrows=⟨options⟩ (default ->)
```

This key adds arrow tips to the previous path segment (a curve or a line).

/tikz/ext/every softpath arrows

(style, initially {})

This style will be applied for every instance of softpath arrows (key version, not the pic).

For arcs the following key needs to be used directly after the arc path operation.

```
/tikz/ext/arc arrows=\langle options\rangle
```

(default ->)

This key adds arrow tips to the previous arc segment.

```
/tikz/ext/every softpath arrows
```

(style, initially {})

This style will be applied for every instance of arc arrows.

Tip: Use an arc with the full 360° to place bended arrow tips along a circle or an ellipse.

6.3 Shifted and bended arrows for the decorations.markings library

Many paths are not properly accessible by the previous methods. If this library is loaded *after* the decorations.markings library, both the \arrow and the \arrowreversed macros are enhanced.

```
\arrow**[\langle options \rangle] {\langle arrow\ end\ tip \rangle}
```

This macro works the same as before but the one-starred version applies the shifting as specified by arrow shift mode and arrow shift factor where as the two-starred version also bends the arrow tip.

```
\arrowreversed**[\langle options \rangle] \{\langle arrow end tip \rangle \}
```

As above, only the arrow end tip is flipped and points in the other direction.

```
TikZ TikZ
```

```
\usetikzlibrary {bending, decorations.markings, ext.arrows-plus}
\tikzset{
    arr/.style={
        postaction=decorate,
        decoration={
            name=markings,
            mark={between positions .25 and 1 step .25 with
            \arrow#1[red]{> _ < _ >}}}}
\tikz[y=1.5cm, >=Stealth, arrows={[round]}, nodes={circle, draw}]
\path            node[arr= ]{Ti\emph kZ} % \arrow*
            (0,-1) node[arr=*]{Ti\emph kZ} % \arrow*
            (0,-2) node[arr=**]{Ti\emph kZ} % \arrow**
            ;
}
```

7 Calendar

```
TikZ Library ext.calendar-plus
\usetikzlibrary{ext.calendar-plus} % 因以 and plain TEX \usetikzlibrary[ext.calendar-plus] % ConTEXt
This library extends the TikZ library calendar.
Q & A: [11, 12, 5] & [28, 49, 47]
```

7.1 Value-keys and nestable if key

The values of following keys are originally stored in some macros that are not accessible by the user. These are now simple value-keys. The @-protected macros are still available, of course.

```
/tikz/day xshift (initially 3ex)
/tikz/day yshift (initially 3.5ex)
/tikz/month xshift (initially 9ex)
/tikz/month yshift (initially 9ex)
```

It is now also possible to nest /tikz/if occurrences.

```
\tikz/if = (\langle conditions \rangle) \langle code \ or \ options \rangle = lse \langle else \ code \ or \ options \rangle (no default)
```

7.2 PGFmath functions

```
weeksinmonthofyear(first weekday, month, year)
\pgfmathweeksinmonthofyear{first weekday}{month}{year}
```

Returns the number of (partial) weeks in the month *month* of year *year* when this month begins on a *first weekday*.

```
lastdayinmonthofyear(month, year)
\pgfmathlastdayinmonthofyear{month}{year}
```

Returns the last day (28, 29, 30 or 31) of month month of year year.

7.3 Week numbering (ISO 8601)

The actual week number algorithm is implemented by the pgfcalendar-ext package/module in section 28.2.

```
/\text{tikz/week code} = \langle code \rangle (no default)
```

Works like /tikz/day code or /tikz/month code, only for weeks.

```
tikz/week text = \langle text \rangle (no default)
```

Works like /tikz/day text or /tikz/month text, only for weeks.

```
/tikz/every week (style, no value)
```

Works like /tikz/every day or /tikz/every month, only for weeks.

```
/tikz/week label left (style, no value)
```

Places the week label to the left of the first day of the month. (For week list and month list where a week does not start on a Monday, the position is chosen "as if" the week had started on a Monday – which is usually exactly what you want.)

```
July

26

1 2 3

27 4 5 6 7 8 9 10

28 11 12 13 14 15 16 17

29 18 19 20 21 22 23 24

30 25 26 27 28 29 30 31
```

```
\usetikzlibrary {ext.calendar-plus}
\tikz
  \calendar[
   week list, month label above centered,
   dates=2022-07-01 to 2022-07-31,
   week label left,
   every week/.append style={
      gray!50!black, font=\sffamily}];
```

8 Layers

TikZ Library ext.layers

```
\usetikzlibrary{ext.layers} % LTEX and plain TEX \usetikzlibrary[ext.layers] % ConTEXt
```

This library extends TikZ's functionalities to put nodes, edges, matrices and pics on a separate layer without having to use the pgfonlayer environment.

Consider this library experimental. If you can, avoid it and use the pgfonlayer environment or change the drawing order.

```
/tikz/ext/layers/patch=node|matrix|pic|edge|all
pre 0.6 /tikz-ext/patch
(no default)
```

Since this library is experimental, its functionality needs to be activated explicitly. Patches exist for

- · node.
- matrix,
- pic²,
- · edge or
- all which applies all the patches at once.

```
/tikz/ext/node on layer=\langle layer \rangle (no default)
pre 0.6 /tikz/node on layer
```

If the node patch is applied, this key places a node on layer $\langle layer \rangle$.

```
/tikz/ext/matrix on layer=\layer\rangle (no default)
pre 0.6 /tikz/matrix on layer
```

If the matrix patch is applied, this key places the matrix on layer $\langle layer \rangle$.

```
/tikz/ext/edge on layer=\langle layer \rangle (no default)
pre 0.6 /tikz/edge on layer
```

If the edge patch is applied, this key places the edge on layer $\langle layer \rangle$.

```
/tikz/ext/pic on layer=\layer\rangle (no default)
pre 0.6 /tikz/pic on layer
```

If the pic patch is applied, this key places the main code of a pic on layer $\langle layer \rangle$.

²Only the normal /tikz/pics/code can be placed on different layers. Both /tikz/pics/background code and /tikz/pics/foreground code will not be affected.

9 Node Families

TikZ Library ext.node-families

```
\usetikzlibrary{ext.node-families} % LTEX and plain TEX \usetikzlibrary[ext.node-families] % ConTEXt
```

With this library the user can instruct multiple nodes to have the same width, height, text width, text height or text width. This uses the hook /tikz/execute at end picture to write the nodes' measurements to the AUX file.

```
Q & A: [14] & [31]
```

Before we get to the interesting keys, a common prefix can be set for the families' names. Initially this is \pgfpictureid- so that families of different pictures don't interact.

```
/tikz/node family/prefix=\langle prefix\rangle
```

(no default, initially \pgfpictureid-)

The family names are prefixed with the value of /tikz/node family/prefix.

9.1 Externalization

As this library usually needs multiple compilations to produce stable pictures it is incompatible with the external library. However, the library provides support for the memoize [57] package.

9.2 Text Box

The following keys – when setup, see below – work with every shape with one single node part.³ Initially though, only circle and rectangle are set up that way.

```
/tikz/node family/text height=\langle name \rangle
```

(no default, initially {})

Nodes with the same $\langle name \rangle$ will have the same text height. An empty $\langle name \rangle$ disables the evaluation by the library.

```
/tikz/node family/text depth=\langle name \rangle
```

(no default, initially {})

Nodes with the same $\langle name \rangle$ will have the same text depth. An empty $\langle name \rangle$ disables the evaluation by the library.

```
/tikz/node family/text width=\langle name \rangle
```

(no default, initially {})

Nodes with the same $\langle name \rangle$ will have the same text width. An empty $\langle name \rangle$ disables the evaluation by the library.

```
/tikz/node family/text=(name)
```

(no default)

Sets text height, text depth and text width.

Since the width of the node's content's box is setup much earlier, the previous key only extends the width of that box which would make the text seem as if it where aligned to the left. With text width family align this can changed.

³Technically, it will also work with shapes with multiple node parts but it will only affect the main node part.

```
/tikz/node family/text width align=(alignment)
```

(no default, initially center)

(alignment) is one of left, center or right.

/tikz/node family/setup shape= $\langle shape \rangle$

(no default)

This adds instructions to the *(shape)*'s definition which adjust the text box's dimensions according to the family.

This should be only used once per shape.

9.3 Minimum Width/Height

While the keys of the previous subsection work well enough for nodes of the same shape (and the same inner seps), for different node shapes the text box dimensions will be used differently for the node's total dimension.

For this, the following keys are necessary. When one of the keys are used the values of minimum width and/or minimum height are set to nf width or nf height respectively.

```
/tikz/node family/width=\langle name \rangle
```

(no default, initially {})

Nodes with the same $\langle name \rangle$ will have the same /pgf/minimum width . An empty $\langle name \rangle$ disables the evaluation by the library.

```
| Too | \usetikzlibrary {positioning,ext.node-families} 
| \tikzexternaldisable % ext.node-families does not work with active externalization 
| \usetikzpicture \text{[nodes={rectangle, draw, node family/width=manual}]} 
| \usetikzpicture \text{[node [below=of a] (b) {Foobar}; 
| \underlied \text{[hode [below=of a] (b) {Foobar}; 
| \underlied \text{[hode [below=of a] (b) {Foobar}; \underlied \
```

```
/tikz/node family/height=⟨name⟩
```

(no default, initially {})

Nodes with the same $\langle name \rangle$ will have the same /pgf/minimum height. An empty $\langle name \rangle$ disables the evaluation by the library.

/tikz/node family/size=(name)

(no default)

Sets both height and width.

9.4 More shapes that support the keys width and height

TikZ Library ext.node-families.shapes.geometric

```
\usetikzlibrary{ext.node-families.shapes.geometric} % LATEX and plain TEX \usetikzlibrary[ext.node-families.shapes.geometric] % ConTEXt
```

This library adds support for the keys /tikz/node family/width and /tikz/node family/height for the shapes of the PGF library shapes.geometric.

Q: [23]

The shapes are also setup for the keys from subsection 9.2.

```
\usetikzlibrary {ext.node-families.shapes.geometric}
\tikzexternaldisable % ext.node-families does not work with active externalization
\begin{tikzpicture}
\foreach \cnt[count=\Cnt] in {a,...,h}
\node[draw, diamond, node family/text=aTOh] (\cnt)
    at (right:\Cnt) {\cnt};
\draw[help lines] (a.south) -- (h.south) (a.north) -- (h.north) (a.base-|a.west) -- (h.base-|h.east);
\end{tikzpicture}
```

10 Nodes

TikZ Library ext.nodes

```
\usetikzlibrary{ext.nodes} % LMT<sub>E</sub>X and plain T<sub>E</sub>X \usetikzlibrary[ext.nodes] % ConT<sub>E</sub>Xt
```

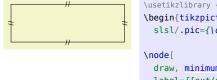

This library extends TikZ's functionalities when it comes to nodes.

```
Q & A: [10, 18] & [33, 42]
```

10.1 Pic as a node

```
/tikz/ext/pic=\langle boolean\rangle
pre 0.6 /tikz/pic
(default true, initially false)
```

This key allows one to use a pic where usually only nodes are accepted, for example as a label.

10.2 Nodes on paths

When nodes are placed along paths they don't interrupt the path at that place. The decoration markings and its /pgf/decoration/mark connection node key can help but only works for straight paths and doesn't play nicely with arrow tips.

This library provides alternatives. These are separated into straight paths, i. e. --, and everything else (including any to path).

10.2.1 Nodes on Lines

```
/tikz/ext/node on line=(anchor specification)
pre 0.6 /tikz/node on line
(style, default {})
```

This installs a /tikz/to path that places *one* node along a straight line but connect the line with it.

This allows a node to be placed *on* a straight line without having to use fill = white or similar tricks to make the line disappear beneath the node.

The optional $\langle anchor specification \rangle$ allows to specify the anchors to which the line should connect. It allows one or two anchors divided by and to be specified.

```
/tikz/ext/nodes on line (style, no value)
pre 0.6 /tikz/nodes on line
```

This is similar to the previous key but allows multiple nodes to be placed on a straight line *if* they are in the correct order (from start to target), don't overlap with each other, the start or the target.

It allows *no* anchor specification.

```
\usetikzlibrary {ext.nodes, quotes}
\tikz[inner sep=.15em, nodes=draw]
\draw[thick, ->, ext/node on line=west and east]
  (0,0) to["0"] (1,1)
        to["1"] (2,0)
        to["2"] (4,1);
```

10.2.2 Nodes on Curves

The following keys need the intersections and the spath3 [54] library to be loaded. They will not be automatically loaded by this library.

Any /pgf/outer sep will be ignored.

If you can, use fill= $\langle bg \ color \rangle$ instead of these keys, it will be much faster and easier.

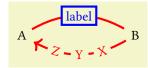

```
/tikz/ext/nodes on curve=\langle to path\rangle (style, default line to)
pre 0.6 /tikz/nodes on curve
```

Similar to nodes on line, this key allows to have nodes on arbitrary paths.

This is not suitable for paths connecting nodes.

```
/tikz/ext/nodes on curve'=⟨to path⟩ (style, default line to)
pre 0.6 /tikz/nodes on curve'
```

As above but suitable for connecting nodes.

10.3 Automatic placement of nodes

The /tikz/auto key allows automatic placement of nodes along a path segment. This library extends this in various ways.

10.3.1 More than left and right

Besides left and right that are provided by TikZ the following placement mechanism are provided:

- ext/left will place a node to the left of the direction of the line,
- ext/right will place a node to the right of the direction of the line,
- ext/above will place a node towards the direction of the line,
- ext/below will place a node against the direction of the line,
- ext/west will place a node towards the left side of the paper,
- ext/east will place a node towards the right side of the paper,
- ext/north will place a node towards the upper side of the paper and
- ext/south will place a node twoards the lower side of the paper.

The placement mechanisms ext/left and ext/right are like the original left and right mechanisms but don't swap sides when /tikz/sloped is used.

Certain cases exist for ext/west, ext/east, ext/north and ext/south placements where it is not clear how a node should be placed. These cases and their behavior can be seen in figure 1.

10.3.2 Offset

Nodes are usually placed with their border (including any outer sep) on the line. With the following option, a node will be shifted a certain offset distance.

```
\label{eq:true or false} \mbox{$\langle$ true or false$} \mbox{$\langle$ default true$} \mbox{$\rangle$}
```

This key activates the offset function.

/tikz/ext/auto offset (initially 1cm)

The offset distance itself.

For the brace decoration, the following keys are provided which needs the decorations.pathreplacing loaded before they can be used.

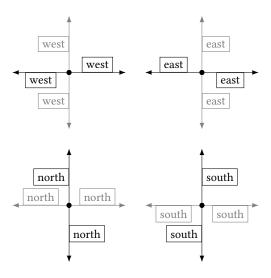

Figure 1: Behavior of ext/est, ext/east, ext/north and ext/south in certain cases

/tikz/ext/nodes/install auto offset for brace decoration= $\langle distance \rangle$ (default 0pt)

This key installs the necessary customizations for the /pgf/decoration/raise key so that the given value is available as an offset.

It also makes available the following keys.

/tikz/ext/auto offset for brace decoration (style, no value)

This sets /tikz/ext/auto offset to \pgfdecorationsegmentamplitude+ (\pgfkeysvalueof/pgf/decoration/raise).

/tikz/ext/every brace node (style, no value)

Using this key on a node along a path that's decorated by the brace decoration will offset the node so that it will be placed at the tip of the brace.

10.3.3 Precise placement

The default behavior of the auto placement mechanism is to snap to one of the eight compass directions.

With this option set to true, the auto placement won't snap to one of the eight compass directions.

This key disables the /tikz/sloped option which in turn will disable this option.

11 Arc to a point

TikZ Library ext.paths.arcto

```
\usetikzlibrary{ext.paths.arcto} % LATEX and plain TEX \usetikzlibrary[ext.paths.arcto] % ConTEXt
```

This library adds the new path operation arc to that specifies an arc to a point – without the user having to specify any angles.

```
\usetikzlibrary {ext.paths.arcto}
\begin{tikzpicture}[ultra thick,dot/.style={label={#1}}]
\coordinate[dot=below left:$a$] (a) at (0,0);
\coordinate[dot=above right:$b$] (b) at (2,3);
\begin{scope}[
  radius=3,
  nodes={
   shape=circle,
   fill=white,
   fill opacity=.9,
   text opacity=1,
   inner sep=+0pt,
   sloped,
   allow upside down
\draw[blue] (a) arc to[]
 node[near start] {.25} node {.5} node[near end] {.75} (b);
              (a) arc to[clockwise]
 node[near start] {.25} node {.5} node[near end] {.75} (b);
\draw[blue!50] (a) arc to[large]
 node[near start] {.25} node {.5} node[near end] {.75} (b);
\draw[red!50] (a) arc to[large, clockwise]
 node[near start] {.25} node {.5} node[near end] {.75} (b);
\end{scope}
\fill[radius=2pt] (a) circle[] (b) circle[];
\end{tikzpicture}
```

```
\path ... arc to[\langle options \rangle] \langle coordinate or cycle \rangle ...;
```

When this operation is used, the path gets extended by an arc that goes through the current point and (*coordinate*).

For two points there exist two circles or four arcs that go through or connect these two points. Which one of these is constructed is determined by the following options that can be used inside of $\langle options \rangle$.

/tikz/arc_to/clockwise (style, no value)

This constructs an arc that goes clockwise.

/tikz/arc to/counter clockwise

(style, no value)

This constructs an arc that goes counter clockwise.

This is the default.

/tikz/arc to/large

(style, no value)

This constructs an arc whose angle is larger than 180° .

/tikz/arc to/small

(style, no value)

This constructs an arc whose angle is smaller than 180°.

/tikz/arc to/rotate=⟨degree⟩

(no default)

Rotates the arc by $\langle degree \rangle$. This is only noticeable when x radius and y radius are different.

/tikz/arc to/x radius=\(value\)

(no default)

This forwards the $\langle value \rangle$ to / tikz/x radius. Its $\langle value \rangle$ is used for the radius of the arc.

/tikz/arc to/y radius=(value)

(no default)

This forwards the \(\forall value \rangle\) to \(\forall tikz/y\) radius. Its \(\forall value \rangle\) is used for the radius of the arc.

/tikz/arc to/radius=(value)

(no default)

This forwards the \(\formall value \rangle\) to both \(/\text{tikz/x}\) radius and \(/\text{tikz/y}\) radius. Its \(\formall value \rangle\) is used for radius of the arc.

/tikz/every arc to

(style, no value)

After /tikz/every arc this will also be applied before any $\langle options \rangle$ are set.

It should be noted that this uses pgfpatharcto for which the TikZ manual warns:

The internal computations necessary for this command are numerically very unstable. In particular, the arc will not always really end at the \langle target coordinate \rangle , but may be off by up to several points. A more precise positioning is currently infeasible due to $T_{\rm E}X$'s numerical weaknesses. The only case it works quite nicely is when the resulting angle is a multiple of 90° .

The arc to path operation will also work only in the canvas coordinate system. The lengths of the vectors (1,0) and (0,1) will be used for the calculation of the radii but no further consideration is done.

12 More Horizontal and Vertical Lines

TikZ Library ext.paths.ortho

```
\usetikzlibrary{ext.paths.ortho} % LATEX and plain TEX \usetikzlibrary[ext.paths.ortho] % ConTEXt
```

This library adds new path specifications |-|, -| - as well as r-ud, r-du, r-lr and r-rl.

12.1 Zig-Zag

Similar to the path operations | - and - | this library adds the path operations | - | and - | -.

```
\path ... | - | [\langle options \rangle] \langle coordinate or cycle \rangle ...;
```

This operation means "first vertical, then horizontal and then vertical again".

```
\path ... - | - [\langle options \rangle] \langle coordinate or cycle \rangle ...;
```

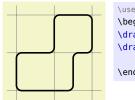

This operation means "first horizontal, then vertical and then horizontal again".

/tikz/ortho/ratio=⟨ratio⟩

(no default, initially 0.5)

This sets the ratio for the middle part of the Zig-Zag connection.

For values $\langle \textit{ratio} \rangle < 0$ and $\langle \textit{ratio} \rangle > 1$ the Zig-Zag lines will look more like Zig-Zig lines.

```
\usetikzlibrary {ext.paths.ortho}
\begin{tikzpicture}[very thick, rounded corners]
\draw[help lines] (-.25, -1.25) grid (2.25, 1.25);
\draw (0, 0) -|- (2, 1) -- (2, 0) -|-[ratio=.25] (0,-1) -- cycle;
\end{tikzpicture}
```

/tikz/ortho/distance=\distance\

(no default)

This sets the distance between the start point and the middle part of the Zig-Zag connection.

For values $\langle distance \rangle < 0$ the distance will be used for the target coordinate.

```
\begin{tikzpicture} [very thick,-latex]
\draw[help lines,-] (-.25, -.25) grid (5.25, 3.25);
\draw (0, 0) -|-[distance= .5cm] ++(2, 1);
\draw (0, 2) -|-[distance=-.5cm] ++(2, 1);
\tikzset{xshift=3cm}
\draw (2, 1) -|-[distance= .5cm] ++(-2, -1);
\draw (2, 3) -|-[distance=-.5cm] ++(-2, -1);
\end{tikzpicture}
```

/tikz/ortho/from center=⟨true or false⟩

(default true)

When nodes get connected the placement of the middle part of the Zig-Zag and the Zig-Zig (see below) connections will be calculated from the border of these nodes. The middle part of the connections can be calculated from the nodes' center if this key is set to true.

New timers are setup for both the Zig-Zag and the Zig-Zig connections, these can be configured through the following keys.

```
\usetikz\library {ext.paths.ortho}
\tikz \draw (0,0) -|- (2,3)
foreach \p in {0.0, 0.25, 0.5, 0.75, 1.0}{
node [pos=\p] {\p}};
```

/tikz/ortho/spacing=\langle number \rangle

(no default, initially 4)

Unless $\langle number \rangle = 0$ is set

- pos = 0 will be at the start,
- pos = 1 will be at the end,
- pos = $\frac{1}{\langle number \rangle}$ will be at the first kink,
- pos = $\frac{\langle number \rangle 1}{\langle number \rangle}$ will be at the second kink and
- \bullet pos = .5 will be in the middle of the middle part of the connection.

```
If \langle number \rangle = 0 then
         • pos = -1 will be at the start,
         • pos = 2 will be at the end,
         • pos = 0 will be at the first kink,
         • pos = 1 will be at the second kink and
         • pos = .5 will still be in the middle of the middle part of the connection.
 /tikz/ortho/middle 0 to 1
                                                                                                                                                                                             (no value)
     This is an alias for spacing = 0.
12.2 Zig-Zig
\path ... r-ud[\langle options \rangle] \langle coordinate or cycle \rangle ...;
     This operation means "first up, then horizontal and then down".
      /tikz/ortho/ud distance=(length)
                                                                                                                                                                           (no default, initially .5cm)
           This sets the distance between the start and the horizontal line to \langle length \rangle.
\path ... r-du[\langle options \rangle] \langle coordinate or cycle \rangle ...;
     This operation means "first down, then horizontal and then up".
      /tikz/ortho/du distance=\langle length\rangle
                                                                                                                                                                           (no default, initially .5cm)
           This sets the distance between the start and the horizontal line to \langle length \rangle.
\path ... r-lr[\langle options \rangle] \langle coordinate or cycle \rangle ...;
     This operation means "left down, then vertical and then right".
      /tikz/ortho/lr distance=(length)
                                                                                                                                                                           (no default, initially .5cm)
           This sets the distance between the start and the vertical line to \langle length \rangle.
\path ... r-rl[\langle options \rangle] \langle coordinate or cycle \rangle ...;
     This operation means "first right, then vertical and then down".
     /tikz/ortho/rl distance=(length)
                                                                                                                                                                           (no default, initially .5cm)
           This sets the distance between the start and the vertical line to \langle length \rangle.
    All distances can be set with one key.
/tikz/ortho/udlr distance=⟨length⟩
                                                                                                                                                                                           (no default)
```

Sets all the previous distances to the same value $\langle length \rangle$.

12.3 Even more Horizontal and Vertical Lines

The following keys can be used to access vertical and horizontal line path operations.

The optional (*length*) can be used to shift the line orthogonally to its direction.

```
(style, no value)
/tikz/horizontal vertical
    This installs to path = - | (\tikztotarget) \tikztonodes that can be used with the path operations to or edge.
/tikz/vertical horizontal
                                                                                                                                                                    (style, no value)
    This installs to path = |- (\tikztotarget) \tikztonodes that can be used with the path operations to or edge.
                                                                                                                                                                  (style, no default)
/tikz/horizontal vertical horizontal=\langle options\rangle
    This installs to path = - |- (\tikztotarget) \tikztonodes that can be used with the path operations to or edge.
/tikz/vertical horizontal vertical=\langle options\rangle
                                                                                                                                                                  (style, no default)
    This installs to path = |-| (\tikztotarget) \tikztonodes that can be used with the path operations to or edge.
/tikz/up horizontal down=\langle options\rangle
                                                                                                                                                                  (style, no default)
    This installs to path = r-ud (\tikztotarget) \tikztonodes that can be used with the path operations to or edge.
/tikz/down horizontal up=\langle options\rangle
                                                                                                                                                                  (style, no default)
    This installs to path = r-du (\tikztotarget) \tikztonodes that can be used with the path operations to or edge.
                                                                                                                                                                  (style, no default)
/tikz/left vertical right=(options)
    This installs to path = r-lr (\tikztotarget) \tikztonodes that can be used with the path operations to or edge.
/tikz/right vertical left=\langle options\rangle
                                                                                                                                                                  (style, no default)
    This installs to path = r-rl (\tikztotarget) \tikztonodes that can be used with the path operations to or edge.
When connecting rectangular nodes, these keys could be useful as well. They all need to be given to a to or edge path operation.
                                                                                                                                                                 (style, default 0pt)
/tikz/only vertical second=\langle length\rangle
    This draws a vertical line from the start point to the target point so that it connects to the target point in the center (or at its border in case it is a node).
    The optional \langle length \rangle can be used to shift the line orthogonally to its direction.
/tikz/only horizontal second=\langle length\rangle
                                                                                                                                                                 (style, default 0pt)
    This draws a horizontal line from the start point to the target point so that it connects to the target point in the center (or at its border in case it is a node).
```

/tikz/only vertical first= $\langle length \rangle$

This draws a vertical line from the start point to the target point so that it connects to the start point in the center (or at its border in case it is a node). The optional $\langle length \rangle$ can be used to shift the line orthogonally to its direction.

/tikz/only horizontal first=\langle length\rangle

(style, default 0pt)

(style, default Opt)

This draws a horizontal line from the start point to the target point so that it connects to the start point in the center (or at its border in case it is a node). The optional $\langle length \rangle$ can be used to shift the line orthogonally to its direction.

Since all previous key are rather cumbersome, one can install shortcuts for these.

/tikz/ortho/install shortcuts

Installs the following shortcuts:

- \mid \rightarrow vertical horizontal
- - \mid \rightarrow horizontal vertical
- -|- \rightarrow horizontal vertical horizontal
- $|-| \rightarrow \text{vertical horizontal vertical}$
- |* \rightarrow only vertical first
- *| \rightarrow only vertical second
- $^{-*}$ \rightarrow only horizontal first
- *- \rightarrow only horizontal second
- r-ud \rightarrow up horizontal down
- r-du \rightarrow down horizontal up
- r-lr \rightarrow left vertical right
- $r\text{-rl} \rightarrow right vertical left$

(style, no value)

13 Extending the Path Timers

TikZ Library ext.paths.timer

```
\usetikzlibrary{ext.paths.timer} % MTEX and plain TEX \usetikzlibrary[ext.paths.timer] % ConTEXt
This library adds timers to the path specifications rectangle, parabola, sin and cos.
```

```
Q & A: [7, 6] & [39, 51]
```

In TikZ, the path specification rectangle, parabola, sin and cos do not provide their own timer, i.e. a node placing algorithm that is dependent on the actual path. For rectangle the timer of the straight line between the rectangle's corners is used, for the other paths, nodes, coordinates, pics, etc. are placed on the last coordinate. This library allows this.

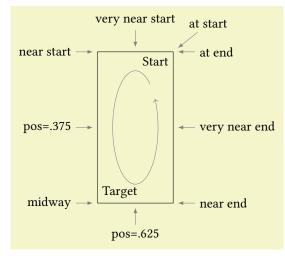

13.1 Rectangle

For the rectangle path operator, the timer starts with pos = 0 (= at start) from the starting coordinate in a counter-clockwise direction along the rectangle. The corners will be at positions 0.0, 0.25, 0.5, 0.75 and 1.0.

```
/tikz/rectangle timer=line or rectangle
```

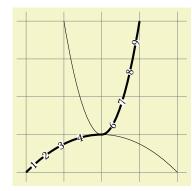

(default rectangle)

By default, the library activates the new (correct) timer for rectangle. With rectangle timer = line the original line timer can be reinstated.

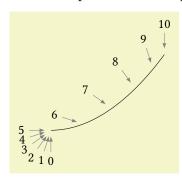

13.2 Parabola

For the parabola path operator the timer is similar to the .. controls .. operator. The position 0.5 will lie at the bend.

If no bend is specified half the positions will collapse into one end of the curve.

```
\usetikzlibrary {ext.paths.timer}
\begin{tikzpicture}[every pin edge/.style={latex-, shorten <=1pt, gray}]
\draw (-2,-2) parabola (1,0)
  foreach \pos in {0, 1, ..., 10} {
    node [pos=\pos/10, pin={[anchor=-18*\pos+90]-18*\pos+270:\pos}]{}
  };
\end{tikzpicture}</pre>
```

13.3 Sine/Cosine

The sin and cos path operators also allow placing of nodes along their paths.

14 Using Images as a Pattern

TikZ Library ext.patterns.images

```
\usetikzlibrary{ext.patterns.images} % LAT<sub>E</sub>X and plain T<sub>E</sub>X \usetikzlibrary[ext.patterns.images] % ConT<sub>E</sub>Xt
```

This library allows to use an image to be used as a repeating pattern for a path.

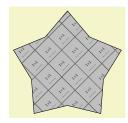

```
Q & A: [17] & [50]
```

With this library arbitrary images (or indeed PDF documents) can be used as a repeating pattern for the background of a path. This is a two-step process:

- 1. Declaring an image as an "image-pattern".
- 2. Using the "image-pattern".

/tikz/image as pattern=\langle options\rangle

(default {})

```
\usetikzlibrary {ext.patterns.images,shapes.geometric}
\pgfsetupimageaspattern[width=.5cm]{grid}{example-image-lx1}
\tikz \node[star, minimum size=3cm, draw,
  image as pattern={name=grid,options={left, bottom, y=-.5cm, rotate=45}}] {};
```

/tikz/image as pattern/name= $\langle name \rangle$

(no default)

Specifies the name of the "image-pattern" to be used.

/tikz/image as pattern/option

(style, no value)

Options that will be used by the internal \pgftext, only keys from /pgf/text should be used.

/tikz/image as pattern/options=(style)

(style, no default)

Appends style /tikz/image as pattern/option.

15 Positioning Plus

TikZ Library ext.positioning-plus

```
\usetikzlibrary{ext.positioning-plus} % LATEX and plain TEX \usetikzlibrary[ext.positioning-plus] % ConTEXt
```

With the help of the positioning and the fit library this extends the placement of nodes.

15.1 Useful corner anchors

The anchors corner north east, corner north west, corner south west and corner south east are defined as "generic anchors", i. e. they are defined for all shapes. This is mostly useful for the placement of circular shapes.

/tikz/corner above left=\specification\ (style, default 0pt)

Similar as /tikz/above left of the TikZ library positioning but uses the corner north west anchor.

/tikz/corner below left=\specification\ (style, default 0pt)

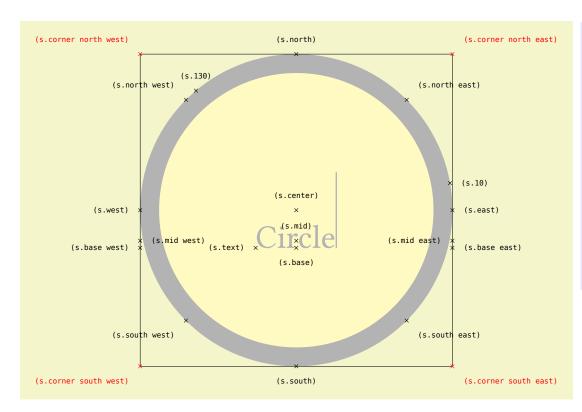

Similar as /tikz/below left of the TikZ library positioning but uses the corner south west anchor.

/tikz/corner above right=\(specification\) (style, default 0pt)

Similar as /tikz/above right of the TikZ library positioning but uses the corner north east anchor.

/tikz/corner below right=(specification) (style, default 0pt)

Similar as /tikz/below right of the TikZ library positioning but uses the corner south east anchor.

```
\usetikzlibrary {ext.positioning-plus}
\Huge
\begin{tikzpicture}
\node[name=s,shape=circle,shape example]
 {Circle\vrule width 1pt height 2cm};
\foreach \anchor/\placement in {
 north west/above left, north/above, north east/above right,
 west/left, center/above, east/right,
 mid west/right, mid/above, mid east/left,
 base west/left, base/below, base east/right,
 south west/below left, south/below, south east/below right,
 text/left, 10/right, 130/above}
 \draw[shift=(s.\anchor)] plot[mark=x] coordinates{(0,0)}
   node[\placement] {\scriptsize\texttt{(s.\anchor)}};
\draw (s.corner north west) rectangle (s.corner south east);
\foreach \anchor/\placement in {
 corner north west/above left, corner north east/above right,
 corner south west/below left, corner south east/below right}
 \draw[red,shift=(s.\anchor)] plot[mark=x] coordinates{(0,0)}
   node[\placement] {\scriptsize\texttt{(s.\anchor)}};
\end{tikzpicture}
```

15.2 Useful placement keys for vertical and horizontal alignment

/tikz/north left=\langle specification\rangle

Like /tikz/left but aligns the nodes at their north border.

This is basically the same as left=of reference.north west, anchor=north east.

(style, default 0pt)

```
\undersite \undersite \text{\text{spositioning-plus}}
\undersite \
```

```
/tikz/north right=\langle specification\rangle
                                                                                                                                                              (style, default 0pt)
    Like /tikz/right but aligns the nodes at their north border.
    This is basically the same as left=of reference.north east, anchor=north west.
                                                                                                                                                              (style, default 0pt)
/tikz/south left=\langle specification\rangle
   Like /tikz/left but aligns the nodes at their south border.
    This is basically the same as left=of reference.south west, anchor=south east.
                                                                                                                                                              (style, default 0pt)
/tikz/south right=\langle specification\rangle
   Like /tikz/right but aligns the nodes at their south border.
    This is basically the same as left=of reference.south east, anchor=south west.
/tikz/west above=\langle specification\rangle
                                                                                                                                                              (style, default 0pt)
    Like /tikz/above but aligns the nodes at their west border.
    This is basically the same as left=of reference.north west, anchor=south west.
/tikz/west below=(specification)
                                                                                                                                                              (style, default 0pt)
   Like /tikz/below but aligns the nodes at their west border.
   This is basically the same as left=of reference.south west, anchor=north west.
/tikz/east above=\langle specification\rangle
                                                                                                                                                              (style, default 0pt)
    Like /tikz/above but aligns the nodes at their east border.
    This is basically the same as left=of reference.north east, anchor=south east.
                                                                                                                                                              (style, default 0pt)
/tikz/east below=(specification)
```

Like /tikz/below but aligns the nodes at their east border.

This is basically the same as left=of reference.south east, anchor=north east.

The same exist for the recently introduces corner anchors, too.

```
(style, default 0pt)
/tikz/corner north left=\langle specification\rangle
    The same as /tikz/north left but uses the new corner anchors.
                                                                                                                                                             (style, default 0pt)
/tikz/corner north right=(specification)
    The same as /tikz/north right but uses the new corner anchors.
/tikz/corner south left=\langle specification\rangle
                                                                                                                                                             (style, default 0pt)
    The same as /tikz/south left but uses the new corner anchors.
/tikz/corner south right=\(specification\)
                                                                                                                                                             (style, default 0pt)
    The same as /tikz/south right but uses the new corner anchors.
                                                                                                                                                             (style, default 0pt)
/tikz/corner west above=(specification)
    The same as /tikz/west above but uses the new corner anchors.
                                                                                                                                                             (style, default 0pt)
/tikz/corner west below=(specification)
    The same as /tikz/west below but uses the new corner anchors.
/tikz/corner east above=(specification)
                                                                                                                                                             (style, default 0pt)
    The same as /tikz/east above but uses the new corner anchors.
/tikz/corner east below=\langle specification\rangle
                                                                                                                                                             (style, default 0pt)
```

The same as /tikz/east below but uses the new corner anchors.

While the $\langle specification \rangle$ of all these keys still accept the same form as with TikZ, the ext.positioning-plus library extends this even more.

The specification after of can contain a list of coordinates (like the fit key of the fit library). This means that the new node will be placed in relation to a rectangular bounding box that fits around all this nodes in the list.

If this list is prefixed with $| \cdot |$, - or +, the new node will also have the same height (|), the same width (-) or both as this bounding box.

This functionality is also available without the placement:

/tikz/fit bounding box=(list of coordinates)

(style, no default)

Creates a rectangular node with the name fit bounding box that encompasses the $\langle \textit{list of coordinates} \rangle$.

/tikz/span vertical=⟨list of coordinates⟩

(style, no default)

Creates a rectangular node with the name fit bounding box that encompasses the $\langle list\ of\ coordinates \rangle$ and sets the $/pgf/minimum\ height\ to\ the\ height\ of\ this\ bounding\ box.$

/tikz/span horizontal=⟨list of coordinates⟩

(style, no default)

Creates a rectangular node with the name fit bounding box that encompasses the $\langle list\ of\ coordinates \rangle$ and sets the $/pgf/minimum\ width\ to\ the\ width\ of\ this\ bounding\ box.$

/tikz/span=⟨list of coordinates⟩

(style, no default)

Is a combination of /tikz/span vertical and /tikz/span horizontal.

As you maybe noticed in the example above, the (specification) also allows a prefix delimited by: which the node distance will be multiplied to with for the placement.⁴

⁴This is probably more useful when /tikz/on grid is used.

16 Scaling Pictures to a Specific Size

TikZ Library ext.scalepicture

```
\usetikzlibrary{ext.scalepicture} % LaTeX and plain TeX \usetikzlibrary[ext.scalepicture] % ConTeXt
```

This library scales TikZ pictures to a specific width or height by scaling the whole picture.

If one of the keys below are used on a TikZ picture, meaning as an option to tikzpicture or $begin{tikzpicture}$, the size of the picture will be measured and written to the Aux file so that it will be available at the next compilation run and an appropriate scaling for the picture can be installed.

\tikzextpicturewidth

Returns the last measured width of the picture.

This will expand to Opt if the picture hasn't been measured before.

\tikzextpictureheight

Returns the last measured height of the picture.

This will expand to 0pt if the picture hasn't been measured before.

/tikz/ext/save picture size

(style, no value)

pre 0.6 /tikz/save picture size

This key is usually used by the keys provided by this library. Normally, this is not needed to be explicitly given.

16.1 Externalization

As this library usually needs multiple compilations to produce stable pictures it is incompatible with the external library.

However, the library provides support for the memoize [57] package. When it is used the arguments to the keys below will be saved as the context of the memo. This means that the arguments need to be a valid \dimexpr expression.

16.2 Keeping the aspect ratio

The following ${\it unstarred}$ keys do not change the aspect ratio of the picture.

```
/tikz/ext/picture width=\langle dimension\rangle
```

(no default)

pre 0.6 /tikz/picture width

Scales the picture so that the width of the picture will be $\langle dimension \rangle$. This will keep the aspect ratio the same.

```
/tikz/ext/minimum picture width=\langle dimension\rangle
```

(no default)

pre 0.6 /tikz/minimum picture width

As above but will not change the size of the picture if its width is greater than $\langle dimension \rangle$.

/tikz/ext/maximum picture width=\langle dimension\rangle

(no default)

pre 0.6 /tikz/maximum picture width

As above but will not change the size of the picture if its width is less than $\langle dimension \rangle$.

/tikz/ext/picture height=\langle dimension\rangle

(no default)

pre 0.6 /tikz/picture height

Scales the picture so that the height of the picture will be $\langle dimension \rangle$. This will keep the aspect ratio the same.

/tikz/ext/minimum picture height=\langle dimension\rangle

(no default)

pre 0.6 /tikz/minimum picture height

As above but will not change the size of the picture if its height is greater than $\langle dimension \rangle$.

/tikz/ext/maximum picture height=\langle dimension\rangle

(no default)

pre 0.6 /tikz/maximum picture height

As above but will not change the size of the picture if its height is less than $\langle dimension \rangle$.

 $/\text{tikz/ext/minimum picture size} = {\langle width \rangle} {\langle height \rangle}$

(no default)

⁵This is the size of the pseudo-node current bounding box.

pre 0.6 /tikz/minimum picture size

Scales the picture so that its height will be at least $\langle width \rangle$ and its height will be at least $\langle height \rangle$.

Scales the picture so that its height will be at most $\langle width \rangle$ and its height will be at most $\langle height \rangle$.

16.3 Changing the aspect ratio

The following *starred* keys do change the aspect ratio.

```
\ttikz/ext/picture width*=\ddimension\d (no default)
```

pre 0.6 /tikz/picture width*

Scales the picture so that the width of the picture will be $\langle dimension \rangle$. This will only scale the x axis.

```
/tikz/ext/minimum picture width*=\langle dimension\rangle (no default)
pre 0.6 /tikz/minimum picture width*
```

As above but will not change the size of the picture if its width is greater than $\langle dimension \rangle$.

```
/tikz/ext/maximum picture width*=(dimension) (no default)
```

pre 0.6 /tikz/maximum picture width*

As above but will not change the size of the picture if its width is less than $\langle dimension \rangle$.

```
/\text{tikz/ext/picture height*} = \langle dimension \rangle (no default)
```

pre 0.6 /tikz/picture height*

Scales the picture so that the height of the picture will be $\langle dimension \rangle$. This will only scale the y axis.

```
/tikz/ext/minimum picture height*=\langle dimension\rangle (no default)
pre 0.6 /tikz/minimum picture height*
```

As above but will not change the size of the picture if its height is greater than *(dimension)*.

```
/tikz/ext/maximum picture height*=(dimension) (no default)
pre 0.6 /tikz/maximum picture height*
```

As above but will not change the size of the picture if its height is less than $\langle dimension \rangle$.

```
\label{eq:continuous_size} $$ \begin{array}{ll} \text{tikz/ext/picture size*} & \text{(no default)} \\ \text{pre 0.6 /tikz/picture size*} \end{array} $$
```

Scales the picture so that its width will be $\langle width \rangle$ and its height will be $\langle height \rangle$.

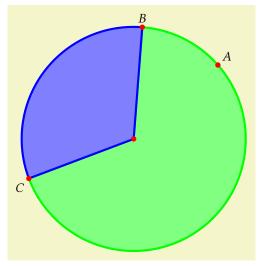

This will scale both axes but independent from each other.

17 Arcs through Three Points

TikZ Library ext.topaths.arcthrough

\usetikzlibrary{ext.topaths.arcthrough} % LATEX and plain TEX \usetikzlibrary[ext.topaths.arcthrough] % ConTEXt

This library allows to use an arc defined by three points.

```
\usetikzlibrary {ext.topaths.arcthrough}
\usetikzpicture}
\usetikzpicture}
\usetikzpicture}
\usetikzpicture
\uzetikzpicture
\uzetikzpictu
```

This can only by used for circles in the canvas coordinate system.

```
/tikz/arc through/through=\(coordinate\) (no default, initially (0,0))
```

The coordinate on the circle that defines – together with the starting and target point – a circle.

```
\label{eq:continuity} $$ $ \text{through/center suffix=} (suffix) $$ (no default, initially ) $$
```

The arc through will define a coordinate named arc through center $\langle suffix \rangle$ so that it can be referenced later.

```
/tikz/arc through/clockwise (no value)
```

The resulting arc will go clockwise from the starting point to the target point.

This will not necessarily go through the through point.

/tikz/arc through/counter clockwise

(no value)

The resulting arc will go counter clockwise from the starting point to the target point. This will not necessarily go through the through point.

/tikz/arc through=⟨key-value⟩

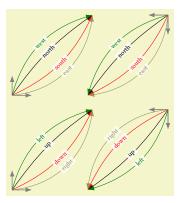

(no default)

This key should be used with to or edge. A parameter other than center suffix, clockwise or counter clockwise will be assumed to be the through coordinate.

18 Autobending

Works like autobend up but bends the curve rightwards.

```
TikZ Library ext.topaths.autobend
    \usetikzlibrary{ext.topaths.autobend} % LATEX and plain TEX
    \usetikzlibrary[ext.topaths.autobend] % ConTFXt
    This library provides various bended to paths that bend in the specified direction.
    Q & A: [22] & [32]
   The keys /tikz/bend left and /tikz/bend left from TikZ bend the requested curve in relation of the connecting coordinates/nodes.
   The keys provided by this library bend the curve in the direction relative to the paper (north, south, west and east) or relative to the current coordinate system (up, down, left
and right).
/tikz/ext/autobend north=\langle angle \rangle
                                                                                                                                                                  (default last value)
    Works like the bend left and bend right options but bends the curve to the top of the page (i. e. it ignores the current transformation).
                                                                                                                                                                  (default last value)
/tikz/ext/autobend south=\langle angle \rangle
    Works like autobend north but bends the curve to the bottom of the page.
/tikz/ext/autobend west=\langle angle \rangle
                                                                                                                                                                  (default last value)
    Works like autobend north but bends the curve to the left of the page.
                                                                                                                                                                  (default last value)
/tikz/ext/autobend east=\langle angle \rangle
    Works like autobend north but bends the curve to the right of the page.
                                                                                                                                                                  (default last value)
/tikz/ext/autobend up=\langle angle \rangle
    Works like the bend left and bend right options but bends the curve upwards (i. e. it observes the current transformation).
/tikz/ext/autobend down=\langle angle \rangle
                                                                                                                                                                  (default last value)
    Works like autobend up but bends the curve downwards.
/tikz/ext/autobend left=\langle angle \rangle
                                                                                                                                                                  (default last value)
    Works like autobend up but bends the curve leftwards.
/tikz/ext/autobend right=\langle angle \rangle
                                                                                                                                                                  (default last value)
```

```
\usetikzlibrary {arrows.meta, ext.topaths.autobend}
\begin{tikzpicture}[
  every path/.append style=-Latex,
  pics/cs/.style={
   /tikz/transform shape,
    code={\draw[help lines, Latex-Latex] (up:1) |- (right:1);}
  nodes={sloped, fill=white, inner ysep=+.1em, fill opacity=.8, text opacity=1, scale=.5}]
\foreach[count=\i] \c/\d in {black/north, red/south,
                             green!50!black/west, yellow!50!black/east}
  \del{draw}(c) (0,0) pic {cs} to[ext/autobend <math>d=1i0] node{\d} +(45:3);
\foreach[count=\i] \c/\d in {black/north, red/south,
                             green!50!black/west, yellow!50!black/east}
  \draw[shift=(right:2), rotate=180, \c]
          (45:-3) pic \{cs\} to[ext/autobend \d=\i0] node\{\d\} (0,0);
\tikzset{shift=(down:2.5)}
\foreach[count=\i] \c/\d in {black/up, red/down,
                             green!50!black/left, yellow!50!black/right}
 \draw[\c] (0,0) pic {cs} to[ext/autobend \d=\i0] node{\d} +(45:3);
\foreach[count=\i] \c/\d in {black/up, red/down,
                             green!50!black/left, yellow!50!black/right}
 \draw[shift=(right:2), rotate=180, \c]
          (45:-3) pic {cs} to[ext/autobend d=1i\theta] node{d} (0,0);
\end{tikzpicture}
```

19 Mirror, Mirror on the Wall

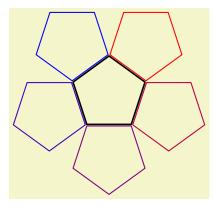

TikZ Library ext.transformations.mirror

```
\usetikzlibrary{ext.transformations.mirror} % LATEX and plain TEX \usetikzlibrary[ext.transformations.mirror] % ConTEXt
```

This library adds more transformations to TikZ.

As explained in section 21, there are two approaches to setting a mirror transformation. As with the commands in PGF, we'll be using a lowercase m for the reflection matrix and an uppercase M for the built-in approach.

19.1 Using the reflection matrix

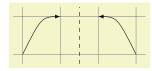

```
\usetikzlibrary {shapes.geometric,ext.transformations.mirror}
\begin{tikzpicture} [line join=round, thick, reg poly/.style={
    shape=regular polygon, regular polygon sides={#1}}]
\node[reg poly=5, minimum size=+2cm, draw, very thick] (a) {};
\foreach \i[evaluate={\lool=(\i-1)/.04}] in {1,...,5}
\node [ext/mirror=(a.corner \i)--(a.side \i), transform shape,
    reg poly=5, minimum size=+2cm, draw=red!\col!blue] {};
\end{tikzpicture}
```

/tikz/ext/xmirror=(value or coordinate)

(default 0pt)

pre 0.6 /tikz/xmirror

Sets up a transformation that mirrors along a horizontal line that goes through point ($\langle value \rangle$, 0) or $\langle coordinate \rangle$.

```
\usetikzlibrary {ext.transformations.mirror}
\begin{tikzpicture}
\draw[help lines] (-0.25, -.25) grid (3.25, 1.25);
\draw[-latex] (0,0) .. controls (.5,1) .. (1,1);
\draw[dashed] (1.5, -.25) coordinate (m) -- (1.5, 1.25);
\draw[ext/xmirror=(m), -latex] (0,0) .. controls (.5,1) .. (1,1);
\end{tikzpicture}
```

/tikz/ext/ymirror=⟨value or coordinate⟩ (default 0pt)

pre 0.6 /tikz/ymirror

Sets up a transformation that mirrors along a vertical line that goes through point $(0, \langle value \rangle)$ or $\langle coordinate \rangle$.

 $/\text{tikz/ext/mirror } x = \langle coordinate \rangle$ (default (0,0))

pre 0.6 /tikz/mirror x

Similar to xmirror, this however uses the xyz coordinate system instead of the canvas system.

```
\begin{tikzpicture} [x=.5cm, y=(45:1cm)] \
\draw[-latex] (0,0) .. controls (.5,1) .. (1,1); \
\draw[dashed] (1.5, -.25) coordinate (m) -- (1.5, 1.25); \
\draw[ ext/xmirror=(m), -latex, red, dotted] (0,0) .. controls (.5,1) .. (1,1); \
\draw[ext/mirror x=(m), -latex] (0,0) .. controls (.5,1) .. (1,1); \
\end{tikzpicture}
```

 $/\text{tikz/ext/mirror } y = \langle coordinate \rangle$ (default (0,0))

pre 0.6 /tikz/mirror y

Similar to ymirror, this however uses the xyz coordinate system instead of the canvas system.

 $/\text{tikz/ext/mirror} = \langle point A \rangle - - \langle point B \rangle$ (no default)

pre 0.6 /tikz/mirror

Sets up a transformation that mirrors along a line that goes through $\langle point A \rangle$ and $\langle point B \rangle$.

When only $\langle point A \rangle$ is given that line goes through $\langle point A \rangle$ and the origin.

19.2 Using built-in transformations

```
/tikz/ext/xMirror=(value or coordinate)
```

(default 0pt)

pre 0.6 /tikz/xMirror

Sets up a transformation that mirrors along a horizontal line that goes through point ($\langle value \rangle$, 0) or $\langle coordinate \rangle$.

```
\usetikzlibrary {ext.transformations.mirror}
\usetikzpicture}
\draw[help lines] (-0.25, -.25) grid (3.25, 1.25);
\draw[-latex] (0,0) .. controls (.5,1) .. (1,1);
\draw[dashed] (1.5, -.25) coordinate (m) -- (1.5, 1.25);
\draw[ext/xMirror=(m), -latex] (0,0) .. controls (.5,1) .. (1,1);
\end{tikzpicture}
```

```
/tikz/ext/yMirror=(value or coordinate)
```

(default 0pt)

pre 0.6 /tikz/yMirror

Sets up a transformation that mirrors along a vertical line that goes through point $(0, \langle value \rangle)$ or $\langle coordinate \rangle$.

```
/tikz/ext/Mirror x=\langle coordinate\rangle
```

(default (0,0))

pre 0.6 /tikz/Mirror x

Similar to xMirror, this however uses the xyz coordinate system instead of the canvas system.

```
\\draw[-latex] (0,0) .. controls (.5,1) .. (1,1);
\\draw[ext/xMirror=(m), -latex, red, dotted] (0,0) .. controls (.5,1) .. (1,1);
\\draw[ext/Mirror x=(m), -latex] (0,0) .. controls (.5,1) .. (1,1);
\\draw[ext/mirror x=(m), -latex] (0,0) .. controls (.5,1) .. (1,1);
\\end{tikzpicture}
```

```
/tikz/ext/Mirror y=⟨coordinate⟩ (default (0,0))
```

pre 0.6 /tikz/Mirror y

Similar to yMirror, this however uses the xyz coordinate system instead of the canvas system.

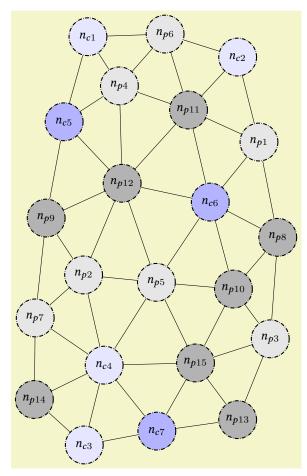

Sets up a transformation that mirrors along a line that goes through $\langle point A \rangle$ and $\langle point B \rangle$.

When only $\langle point A \rangle$ is given that line goes through $\langle point A \rangle$ and the origin.

Part III

PGF Libraries

These libraries (should) work with both PGF and TikZ.

```
\usetikzlibrary {graphs,graphdrawing,ext.misc} \usegdlibrary {force}
\tikzset{
  mynode/.style={
    circle, minimum size=10mm, draw, densely dashdotted, thick,
    decide color/.expand once=#1},
  decide color/.style 2 args={
    /utils/TeX/if=c#1
      {/utils/TeX/ifnum={#2<5}{bluelight}{bluedark}}
      {/utils/TeX/ifnum={#2<8}{light}{dark}}},
  light/.style={fill=gray!20}, bluelight/.style={fill=blue!10},
  dark/.style ={fill=gray!60}, bluedark/.style ={fill=blue!30}}
\tikz\graph[
  spring electrical layout, vertical=c2 to p13,
  node distance=1.5cm, typeset=$n_{\tikzgraphnodetext}$,
  nodes={mynode=\tikzgraphnodetext}] {
  % outer ring
  c2 -- {p1, p11, p6};
    p1 -- {p8, c6, p11};
      p8 -- {p3, p10, c6};
       p3 -- {p13, p15, p10};
         p13 -- {p15, c7};
           c7 -- {c3, c4, p15};
           c3 -- {p14, c4};
           p14 -- {p7, c4};
         p7 -- {p9, p2, c4};
       p9 -- {c5, p12, p2};
     c5 -- {c1, p4, p12};
   c1 -- {p6, p4};
  p6 -- {p11, p4};
  % inner ring
  p11 -- {c6, p12, p4};
  p5 -- {c6 -- {p10, p12}, p10 -- p15, p15 -- c4, c4 -- p2, p2 -- p12, p12 -- p4};
};
```

20 Arrow Tips

TikZ Library ext.arrows

```
\usepgflibrary{ext.arrows} % \&T_EX and plain T_EX and pure pgf \usepgflibrary[ext.arrows] % ConT_EXt and pure pgf \usetikzlibrary{ext.arrows} % \&T_EX and plain T_EX when using TikZ \usetikzlibrary[ext.arrows] % ConT_EXt when using TikZ This library adds arrows to PGF/TikZ.

Q & A: [15, 9, 4, 13] & [43, 30, 48, 41]
```

The arrow tips of the arrows.meta library always just touch the end of original line – which is usually what you want.

But for some arrow tips (and when they lie along a path) it makes sense that these tips shoot a bit over the end of the line. This is why these arrow tips exist. They can be categorized into three groups:

- 1. Centered
- 2. Untipped
- 3. Overtipped⁶

Not all original arrow tips got all variants. For a summary, refer to table on the right side. As with the original tips of the arrows.meta library these can be organized in the following categories.

	Hooks	}} }	_	-
	Straight Barb	\Longrightarrow	-	_
	Tee Barb	$\overline{\mathbf{H}}$	\mathbf{I}	_
	Bar	-	\longrightarrow	_
	Bracket]]]]]]	-
Geometric	Circle	• • •	• • •	-
	Ellipse	•	•	_
	Kite	**	-	_
	Diamond	**	_	_
	Turned Square	* * *	-	_
	LaTeX	_	-	_
	Square		_	-
	Rectangle		_	_
	Stealth	>>>	_	_
	Triangle	$\longmapsto \flat$	-	-
Rays	Rays	×××	-	-

Centered

Untipped

Overtipped

Original

Arc Barb

Parenthesis

Group

Barbed

⁶The Overtipped arrow tips aren't yet implemented.

20.1 Centered

20.1.1 Barbed Arrow Tips

Arrow Tip Kind ext_Centered Arc Barb

pre 0.6 Centered Arc Barb

This is a variant of the Arc Barb tip. The center of the arc lies on the original end of the path.

Arrow Tip Kind ext_Centered Bar

pre 0.6 Centered Bar

A variant of the simple Bar tip. This is a simple instance of ext Centered Tee Barb for length zero.

The middle of the line will lie on original end of the path.

Arrow Tip Kind ext_Centered Bracket

pre 0.6 Centered Bracket

This is a variant of the Bracket tip and therefore an instance of the ext_Centered Tee Barb arrow tip that results in something resembling a bracket.

The middle of the vertical part will lie on the original end of the path.

Arrow Tip Kind ext_Centered Hooks

pre 0.6 Centered Hooks

A variant of the Hooks tip. The starting point of the hooks will lie on the original end of the path.

Arrow Tip Kind ext_Centered Parenthesis

pre 0.6 Centered Parenthesis

This is a variant of the Parenthesis tip and thus an instance of the ext_Centered Arc Barb arrow tip.

Arrow Tip Kind ext_Centered Straight Barb

pre 0.6 Centered Straight Barb

A variant of the Straight Barb tip.

Arrow Tip Kind ext_Centered Tee Barb

pre 0.6 Centered Tee Barb

A variant of the Tee Barb tip.

The middle of the vertical part will lie on the original end of the path.

20.1.2 Geometric Arrow Tips

Arrow Tip Kind ext_Centered Circle

pre 0.6 Centered Circle

A variant of the Circle tip. The center of the circle will lie on the original end of the path.

Arrow Tip Kind ext Centered Diamond

pre 0.6 Centered Diamond

This is a variant of the Diamond tip and thus an instance of ext_Centered Kite where the length is larger than the width.

Arrow Tip Kind ext Centered Ellipse

pre 0.6 Centered Ellipse

This is a variant of the Ellipse tip and thus another name for the ext Centered Circle tip that is twice as wide as high.

Arrow Tip Kind ext_Centered Kite

pre 0.6 Centered Kite

A variant of the Kite tip.

The widest part will lie on the original end of the path.

${\bf Arrow}\; {\bf Tip}\; {\bf Kind}\; {\tt ext_Centered}\; {\tt Rectangle}$

pre 0.6 Centered Rectangle

A variant of the Rectangle tip. By default, it is twice as long as high.

Arrow Tip Kind ext_Centered Square

pre 0.6 Centered Square

A variant of the Square tip.

Arrow Tip Kind ext_Centered Stealth

pre 0.6 Centered Stealth

This is a variant of the Stealth tip.

The weighted center will lie at the original end of the path.

Arrow Tip Kind ext Centered Triangle

pre 0.6 Centered Triangle

This is a variant of the Triangle tip and thus an instance of the ext Centered Kite tip with zero inset.

Arrow Tip Kind ext Centered Turned Square

pre 0.6 Centered Turned Square

This is a variant of the Turned Square tip and thus an instance of the ext_Centered Kite tip with identical width and height and mid-inset.

20.1.3 Special Arrow Tips

Arrow Tip Kind ext_Centered Rays

pre 0.6 Centered Rays

A variant of the Rays tip. The origin of the rays will lie on the original end of the path.

20.2 Untipped

20.2.1 Barbed Arrow Tips

Arrow Tip Kind ext Centered Arc Barb

pre 0.6 Centered Arc Barb

This is a variant of the Arc Barb tip. The arrow tip will protrude half its line width over the original end of the path.

Arrow Tip Kind ext_Untipped Bar

pre 0.6 Untipped Bar

A variant of the simple Bar tip. This is a simple instance of ext_Untipped Tee Barb for length zero.

The middle of the line will lie on original end of the path.

Arrow Tip Kind ext_Untipped Bracket

pre 0.6 Untipped Bracket

This is a variant of the Bracket tip and therefore an instance of the ext_Untipped Tee Barb arrow tip that results in something resembling a bracket.

The arrow tip will protrude half its line width over the original end of the path.

Arrow Tip Kind ext_Untipped Parenthesis

pre 0.6 Untipped Parenthesis

This is a variant of the Parenthesis tip and thus an instance of the ext_Untipped Arc Barb arrow tip.

Arrow Tip Kind ext_Untipped Tee Barb

pre 0.6 Untipped Tee Barb

A variant of the Tee Barb tip.

The middle of the vertical part will lie on the original end of the path.

20.2.2 Geometric Arrow Tips

Arrow Tip Kind ext_Untipped Circle

pre 0.6 Untipped Circle

A variant of the Circle tip. This tip will protrude half its line width over the original end of the path.

Arrow Tip Kind ext_Untipped Ellipse

pre 0.6 Untipped Ellipse

This is a variant of the Ellipse tip and thus another name for the ext Untipped Circle tip that is twice as wide as high.

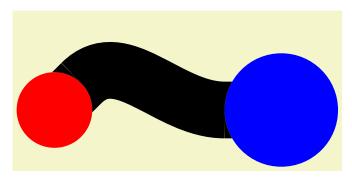

20.3 Original Arrow Tips

Arrow Tip Kind ext_Hug Cap

pre 0.6 Hug Cap

This arrow tips will hug a circle that would touch the end of the path.

Use the /pgf/arrow keys/length key to set up the radius of that circle.

Arrow Tip Kind ext_Loop

pre 0.6 Loop

This arrow tip attaches a one-sided loop to the end of the line. The length refers to the length of the whole tip while the radius specifies the radius of the three rounded corners. The width of the tip is twice the length (but can't specified independently).

Appearance of the below at line width	0.4pt	0.8pt	1.6pt
ext_Loop[]	— , thin	— ₱ thick	-
ext_Loop[sep] ext_Loop[]	— ₱ ₱ thin	− ₽ thick	
<pre>ext_Loop[sep] . ext_Loop[]</pre>	— ₽₽ thin	— ₱₱ thick	
ext_Loop[open]	\longrightarrow thin	—— thick	
ext_Loop[open, swap]	\longrightarrow thin	—→ thick	
ext_Loop[length=5pt,radius=0pt]	— , thin	— ≠ thick	
ext_Loop[reversed]	——¶ thin	—• thick	-
ext_Loop[slant=.3]	— , thin	−− thick	—
ext_Loop[red]	——• thin	— ₽ thick	

The following options have no effect: harpoon, round, line width. On double lines, the arrow tip will not look correct.

21 Transformations: Mirroring

PGF Library ext.transformations.mirror

```
\usepgflibrary{ext.transformations.mirror} % LATEX and plain TEX \usepgflibrary[ext.transformations.mirror] % ConTEXt
```

This library adds mirror transformations to PGF.

Two approaches to mirror transformation exist:

- Using the reflection matrix (see left column).
 This depends on \pgfpointnormalised which involves the sine and the cosine functions of PGFmath.
- Using built-in transformations (see right column).
 This depends on \pgfmathanglebetweenpoints which involves the arctangent (atan2) function of PGFmath.

Which one is better? I don't know. Choose one you're comfortable with.

21.1 Using the reflection matrix

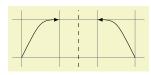

The following commands use the reflection matrix that sets the transformation matrix following

$$A = \frac{1}{\|\vec{l}\|^2} \begin{bmatrix} l_x^2 - l_y^2 & 2l_x l_y \\ 2l_x l_y & l_y^2 - l_x^2 \end{bmatrix}.$$

$\protect\pro$

pre 0.6 \pgftransformxmirror

Sets up a transformation that mirrors along a vertical line that goes through point ($\langle value \rangle$, 0).

```
\usepgflibrary {ext.transformations.mirror}
\begin{tikzpicture}
\draw[help lines] (-.25, -.25) grid (3.25, 1.25);
\draw[-latex] (0,0) .. controls (.5,1) .. (1,1);
\draw[dashed] (1.5, -.25) -- (1.5, 1.25);
\pgfexttransformxmirror{1.5}
\draw[-latex] (0,0) .. controls (.5,1) .. (1,1);
\end{tikzpicture}
```

21.2 Using built-in transformations

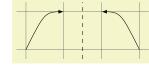

The following commands use a combination of shifting, rotating, -1 scaling, rotating back and shifting back to reach the mirror transformation.

The commands are named the same as on the left side, only the m in mirror is capitalized.

$\protect\pro$

pre 0.6 \pgftransformxMirror

Sets up a transformation that mirrors along a vertical line that goes through point ($\langle value \rangle$, 0).

```
\usepgflibrary {ext.transformations.mirror}
\begin{tikzpicture}
\draw[help lines] (-.25, -.25) grid (3.25, 1.25);
\draw[-latex] (0,0) .. controls (.5,1) .. (1,1);
\draw[dashed] (1.5, -.25) -- (1.5, 1.25);
\pgfexttransformxMirror{1.5}
\draw[-latex] (0,0) .. controls (.5,1) .. (1,1);
\end{tikzpicture}
```

$\protect\pro$

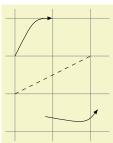

pre 0.6 \pgftransformymirror

Sets up a transformation that mirrors along a horizontal line that goes through point $(0, \langle value \rangle)$.

$\protect\pro$

pre 0.6 \pgftransformmirror

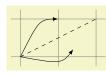

Sets up a transformation that mirrors along the line that goes through $\langle point A \rangle$ and $\langle point B \rangle$.

$\protect\pro$

pre 0.6 \pgfqtransformmirror

Sets up a transformation that mirrors along the line that goes through the origin and $\langle point A \rangle$.

```
\usepgflibrary {ext.transformations.mirror}
\begin{tikzpicture}
\draw[help lines] (-.25, -.25) grid (2.25, 1.25);
\draw[-latex] (0,0) .. controls (.5,1) .. (1,1);
\draw[dashed] (0, 0) -- (2, 1);
\pgfextqtransformmirror{\pgfpointxy{2}{1}}
\draw[-latex] (0,0) .. controls (.5,1) .. (1,1);
\end{tikzpicture}
```

$\protect\pro$

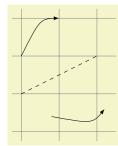

pre 0.6 \pgftransformyMirror

Sets up a transformation that mirrors along a horizontal line that goes through point $(0, \langle value \rangle)$.

$\protect\pro$

pre 0.6 \pgftransformMirror

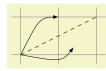

Sets up a transformation that mirrors along the line that goes through $\langle point A \rangle$ and $\langle point B \rangle$.

$\protect\pro$

pre 0.6 \pgfqtransformMirror

Sets up a transformation that mirrors along the line that goes through the origin and $\langle point A \rangle$.

```
\usepgflibrary {ext.transformations.mirror}
\begin{tikzpicture}
\draw[help lines] (-.25, -.25) grid (2.25, 1.25);
\draw[-latex] (0,0) .. controls (.5,1) .. (1,1);
\draw[dashed] (0, 0) -- (2, 1);
\pgfextqtransformMirror{\pgfpointxy{2}{1}}
\draw[-latex] (0,0) .. controls (.5,1) .. (1,1);
\end{tikzpicture}
```

22 Shape: Circle Arrow

TikZ Library ext.shapes.circlearrow

```
\usepgflibrary{ext.shapes.circlearrow} % LATEX and plain TEX and pure pgf
    \usepgflibrary[ext.shapes.circlearrow] % ConT<sub>F</sub>Xt and pure pgf
    \usetikzlibrary{ext.shapes.circlearrow} % MFX and plain TFX when using TikZ
    \usetikzlibrary[ext.shapes.circlearrow] % ConTFXt when using TikZ
    A circular shape named circle arrow that has an arc as its background path that can have an arrow tip.
    Q & A: [26] & [45]
Shape circle arrow
    This shape is an arrow whose path is an arc – defined very similar to the arc path operation – that can possibly be customized with arrow tips.
                                                                                                                                                   (no default, initially {})
     /pgf/circle arrow start angle=(start angle)
         Sets the start angle.
     /pgf/circle arrow end angle=\(\left(end angle\right)\)
                                                                                                                                                   (no default, initially {})
         Sets the end angle.
     /pgf/circle arrow delta angle=(delta angle)
                                                                                                                                                   (no default, initially {})
         Sets the delta angle.
                                                                                                                                                    (no default, initially -)
     /pgf/circle arrow arrows=\(\start\) arrow tip specification\\(\cap \)-\(\lambda\) arrow tip specification\(\rangle \)
         The specification will be forwarded to \pgfsetarrows.
    A few handful styles are pre-defined.
     /pgf/circle arrow turn left north
                                                                                                                                                                (no value)
         Sets circle arrow start angle = 100, circle arrow delta angle = 340 and circle arrow arrows = ->.
                                                                                                                                                                (no value)
     /pgf/circle arrow turn left east
         As above but circle arrow start angle = 10.
                                                                                                                                                                (no value)
     /pgf/circle arrow turn left west
         As above but circle arrow start angle = 280.
     /pgf/circle arrow turn left south
                                                                                                                                                                (no value)
         As above but circle arrow start angle = 190.
```

/pgf/circle arrow turn right north

Sets circle arrow start angle = 100, circle arrow delta angle = 340 and circle arrow arrows = <-.

/pgf/circle arrow turn right east

(no value)

(no value)

As above but circle arrow start angle = 10.

/pgf/circle arrow turn right west

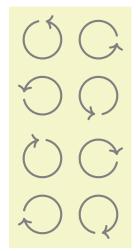

(no value)

As above but circle arrow start angle = 280.

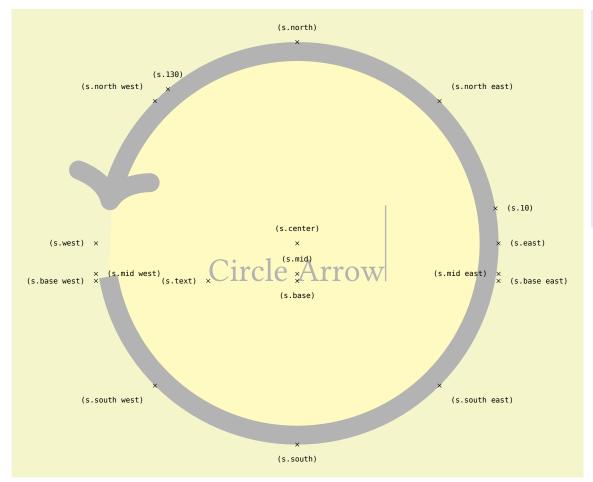

/pgf/circle arrow turn right south

(no value)

As above but circle arrow start angle = 190.

```
\begin{tikzpicture}
\begin{tikzpicture}
\matrix[matrix of nodes, draw=none, row sep=lem, column sep=lem,
    every node/.style={draw=gray, shape=circle arrow, ultra thick, inner sep=lem}
] (m) {
    [[circle arrow turn left north]] & [[circle arrow turn left east]] \\
    [[circle arrow turn left west]] & [[circle arrow turn left south]] \\
    [[circle arrow turn right north]] & [[circle arrow turn right east]] \\
    [[circle arrow turn right west]] & [[circle arrow turn right south]] \\
};
\end{tikzpicture}
```

```
\usetikzlibrary {ext.shapes.circlearrow}
\begin{tikzpicture}\Huge
\node[name=s, shape=circle arrow,
 circle arrow turn left west, shape example]
 {Circle Arrow\vrule width 1pt height 2cm};
\foreach \anchor/\placement in
 {north west/above left, north/above,
  north east/above right,
  west/left, center/above, east/right,
  mid west/right, mid/above, mid east/left,
  base west/left, base/below, base east/right,
  south west/below left, south/below,
  south east/below right,
  text/left, 10/right, 130/above}
  \draw[shift=(s.\anchor)] plot[mark=x] coordinates{(0,0)}
    node[\placement] {\scriptsize\texttt{(s.\anchor)}};
\end{tikzpicture}
```

23 Shape: Circle Cross Split

TikZ Library ext.shapes.circlecrosssplit

```
\label{thm:contents} $$\sup\{\text{ext.shapes.circlecrosssplit}\} $$ Lambda_EX $$ and plain $T_EX$ and pure pgf $$ usepgflibrary[ext.shapes.circlecrosssplit] $$ ConT_EXt$ and pure pgf $$ usetikzlibrary[ext.shapes.circlecrosssplit] $$ Lambda_EX$ and plain $T_EX$ when using $TikZ$ usetikzlibrary[ext.shapes.circlecrosssplit] $$ ConT_EXt$ when using $TikZ$ A circular shape with four parts that can be individually filled. $$Q A: [19] & [46]
```

Shape circle cross split

This shape has four node parts that are placed near the center of a circle.

```
/pgf/circle cross split part fill=\{\langle list \rangle\}
```

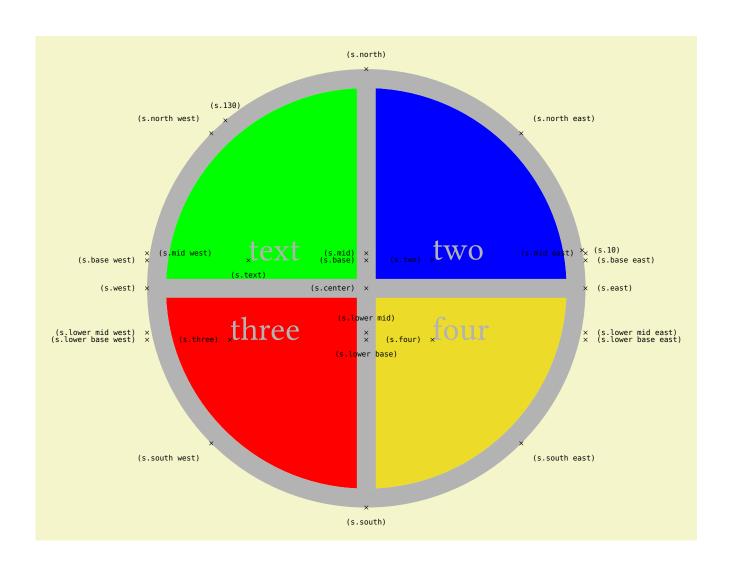

(no default, initially none)

Sets the custom fill color for each node part shape. The items in $\langle list \rangle$ should be separated by commas (so if there is more than one item in $\langle list \rangle$, it must be surrounded by braces). If $\langle list \rangle$ has less entries than node parts, then the remaining node parts use the color from the last entry in the list. This key will automatically set /pgf/circle cross split uses custom fill.

```
/pgf/circle cross split uses custom fill=\langle boolean \rangle
```

(default true)

This enables the use of a custom fill for each of the node parts (including the area covered by the inner sep). The background path for the shape should not be filled (e.g., in TikZ, the fill option for the node must be implicitly or explicitly set to none). Internally, this key sets the TEX-if \ifpgfcirclecrosssplitcustomfill appropriately.

```
\usepgflibrary {ext.shapes.circlecrosssplit}
\begin{tikzpicture}\Huge

    A circular shape that has customizable rings around it.
    Q & A: [3] & [36]
Shape heatmark
                                                                                                                                                             (no default, initially 3)
     /pgf/heatmark arcs=\(arcs num\)
          Sets the number of arc around the circle to \langle arcs num \rangle.
                                                                                                                                                           (no default, initially 4pt)
     /pgf/heatmark arc width=\(\langle arc width\rangle\)
          Sets the width of the rings around the circle to (arc width).
     /pgf/heatmark arc sep=(sep length)
                                                                                                                                                           (no default, initially 1pt)
         Sets the whitespace between the rings to (sep length).
                                                                                                                                                             (no default, initially 3)
     /pgf/heatmark arc rings=(rings num)
          Sets the number of rings around the circle to (rings num)
     /pgf/heatmark arc sep angle=\langle angle \rangle
                                                                                                                                                            (no default, initially 20)
         Sets the whitespace angle between the arcs in one ring to \langle sep\ angle \rangle.
     /pgf/heatmark inner opacity=\langle inner opacity\rangle
                                                                                                                                                           (no default, initially 0.8)
         Sets the opacity of the inner ring to (inner opacity).
     /pgf/heatmark outer opacity=\langle low opacity\rangle
                                                                                                                                                           (no default, initially 0.2)
          Sets the opacity of the outer ring to (outer opacity).
         The opacity of the rings between the outer and the inner ring will be interpolated by these two opacities.
    This shape takes the value of /pgf/shape border rotate into consideration.
    For every ring and for every arc the following styke keys are tried.
                                                                                                                                                                    (style, no value)
     /pgf/heatmark ring \langle ring number \rangle
```

```
/pgf/heatmark arc (arc number) (style, no value)
/pgf/heatmark ring (ring number) arc (arc number) (style, no value)
```

The PGFshape is setup in a way that even TikZ styles can be used with a little bit work:

It is best to use this shape with no actual border (draw = none) and the outer sep set to zero.

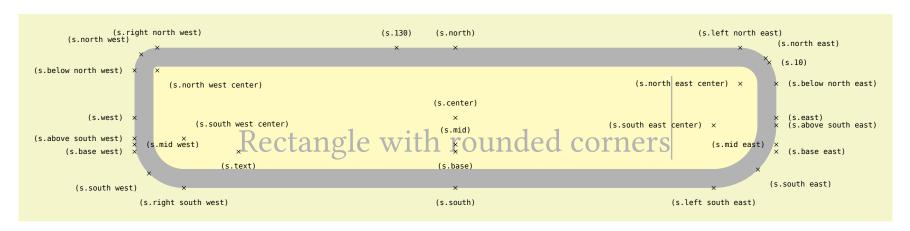

```
\usetikzlibrary {ext.shapes.heatmark}
\begin{tikzpicture}\Huge
\node[name=s, shape=heatmark, shape example,
 fill=blue!25, draw=none, outer sep=0pt]
  {Heatmark\vrule width 1pt height 2cm};
\foreach \anchor/\placement in

```

26 Shape: Superellipse

TikZ Library ext.shapes.superellipse \usepgflibrary{ext.shapes.superellipse} % LMTFX and plain TFX and pure pgf \usepgflibrary[ext.shapes.superellipse] % ConTFXt and pure pgf \usetikzlibrary{ext.shapes.superellipse} % LATEX and plain TEX when using TikZ \usetikzlibrary[ext.shapes.superellipse] % ConTFXt when using TikZ Shape in the form of a "superellipse". **Q & A:** [52] & [29]

Shape superellipse

This shape is defined by formula

$$\left| \frac{x}{r_x} \right|^m + \left| \frac{y}{r_y} \right|^n = 1$$

and will be plotted by

$$x(t) = |\cos t|^{\frac{2}{m}} \cdot r_x \operatorname{sgn}(\cos t)$$

$$y(t) = |\sin t|^{\frac{2}{n}} \cdot r_y \operatorname{sgn}(\sin t)$$

where r_x is half the node's width and r_y is half the node's height.

```
This sets m.
/pgf/superellipse y exponent=\(\gamma\) exponent\(\rightarrow\)
     This sets n.
/pgf/superellipse step=(step)
    This specifies the step of the underlying plot handler. The smaller \langle step \rangle is, the slower computation will be.
```

Sensible values for (step) are integer dividers of 90, i. e. 2, 3, 5, 6, 9, 10, 15, 18, 30 and 45.

/pgf/superellipse exponent=\(exponent \)

/pgf/superellipse x exponent= $\langle x \ exponent \rangle$

Sets both superellipse x exponent and superellipse y exponent to $\langle exponent \rangle$.

(no default, initially 2.5)

(no default, initially 2.5)

(no default, initially 5)

Notes on Implementation For implementing this shape, additional mathematical functions were declared.

```
superellipsex(t, 2/m, r_x)
\pgfmathsuperellipsex{t}{2/m}{r_x}
```

Returns the *x* value on a point of the superellipse with its center on the origin following

$$x = r_x \cos^{2/m} t$$

for values of $0 \le t \le 90$.

superellipsey(t, 2/n, r_y) \pgfmathsuperellipsey{t}{2/n}{ r_y }

Returns the y value on a point of the superellipse with its center on the origin following

$$y = r_{\nu} \cos^{2/n} t$$

for values of $0 \le t \le 90$.

Both PGFmath functions can be used at once with the following macro.

```
\pgfmathsuperellipseXY\{\langle t \rangle\}\{\langle 2/m \rangle\}\{\langle 2/n \rangle\}\{\langle a \rangle\}\{\langle b \rangle\}
```

Returns the x value (in \pgfmathresultX) and the y value (in \pgfmathresultY) of the superellipse with its center on the origin following

$$x = a \cos^{2/m} t$$

$$y = b \cos^{2/n} t$$

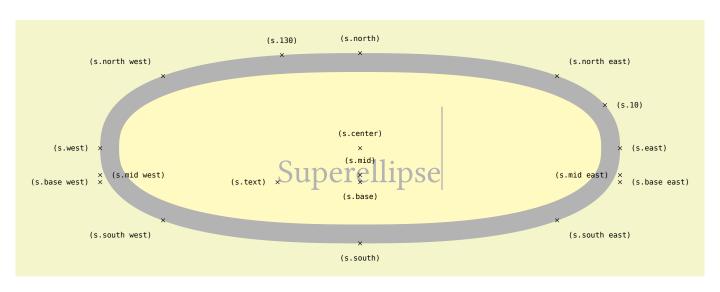

for values of $0 \le t \le 90$.

Note: all arguments must be a valid number since they will not be parsed by PGFmath.

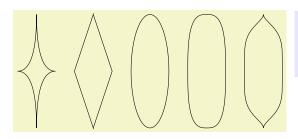

And additional internal macro was defined following the original naming scheme.

```
\verb|\pgfutil@prefix@macrotomacro{|\langle macro 1 \rangle|} {\langle macro 2 \rangle|}
```

Adds the once-expansion of $\langle macro~2 \rangle$ in front of $\langle macro~1 \rangle$.

```
\usetikzlibrary {ext.shapes.superellipse}
\usetikzpicture}[superellipse step=1]\text{Huge}
\undersonde[name=s, shape=superellipse, shape example] {Superellipse\vrule width 1pt height 2cm};
\text{foreach \anchor/\placement in}
    {north west/above left, north/above, north east/above right,

\end{tikzpicture}
```

27 Shape: Uncentered Rectangle

PGF Library ext.shapes.uncenteredrectangle

```
\usepgflibrary{ext.shapes.uncenteredrectangle} % LATEX and plain TEX \usepgflibrary[ext.shapes.uncenteredrectangle] % ConTEXt
```

A rectangle that has a variable horizontal center with three node parts.

```
Q & A: [55, 25] & [37, 34]
```

Shape uncentered rectangle

For some alignment problems, this shape could be useful.

It has three node parts: the standard text part, the left part that is to the left of text and the right part that is to the right of text.

When edges are to be connected with this shape, the following key changes to which inner center this shape will calculate the appropriate point on the border.

```
/pgf/uncentered rectangle center=\langle left \rangle or \langle text \rangle or \langle right \rangle or \langle real \rangle
```

(no default, initially text)

Sets the center that is to be used for connecting edges.

This will also move the anchors north, mid, base and south along. In the picture below, this are marked red.

```
/pgf/uncentered rectangle use saved center=\langle true \rangle or \langle false \rangle
```

(default true)

When this is set to true, the border anchors will use the horizontal center that was used when the node was created.

For support of the cd library of the tikz-cd package, this shape also supports a dynamic y value for its anchors center, west and east.

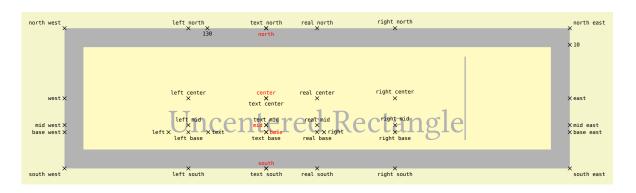

```
/pgf/uncentered rectangle center yshift=\langle dimension\rangle
```

(no default, initially {})

This determines the distance between the baseline and the center anchors.

If $\langle dimension \rangle$ is empty, the real vertical center will be used.

For use with cd, set this to axis_height.

```

                                                                                                     right/right,
                                              130/below,
                                                                                                                       text/right}{
   plot[mark=x, only marks] coordinates {(n.\anchor)}
   node[inner sep=.1em, style \anchor/.try, style/.expand once=\pos] {\tiny\ttfamily\anchor}};
\end{tikzpicture}
```

TikZ Library ext.shapes.uncenteredrectangle

\usetikzlibrary{ext.shapes.uncenteredrectangle} % LATEX and plain TEX \usetikzlibrary[ext.shapes.uncenteredrectangle] % ConTEXt

This library extends the cd library (from the tikz-cd package) so that it can be used with the uncentered rectangle shape.

Q: [53]

This library provides only one key.

/tikz-ext/tikz-cd fix (style, no value)

This key installs various "fixes" to the /tikz/commutative diagrams/every diagram style:

• Firstly, is defines a /tikz/matrix of math nodes key (only for the tikzcd environment) which allows to toggle the /tikz/commutative diagrams/math mode for

each node.⁷

• The helpful macro \uncrec will be installed.

```
\uncrec{\langle left \rangle}{\langle center \rangle}{\langle right \rangle}
```

When used as the content of uncentered rectangle, the node parts will be setup so that $\langle left \rangle$ is in the left part of the node part etc.

• Since math mode will be disabled with the uncentered rectangle, it is automatically enabled for each node part with \uncrec but it can be disabled with the following key.

/tikz/uncrec math mode= $\langle true \rangle$ or $\langle false \rangle$

(default true)

When enabled the contents of \uncrec will be set in math mode.

• For easy access to the uncentered rectangle shape, the following keys are available inside a Commutative Diagram.

 $/\text{tikz/uncrec} = \langle left \rangle \text{ or } \langle text \rangle \text{ or } \langle right \rangle \text{ or } \langle real \rangle$

(style, no default, initially text)

This key sets the shape to uncentered rectangle and /pgf/uncentered rectangle center to its argument.

/tikz/commutative diagrams/install uncentered rectangle in columns=⟨column⟩

(style, no default)

All nodes in column (*column*) will be set to the uncentered rectangle shape.

$$C_{\%_1}$$
 $m_{r_1} = C_{\%_2} - C_{\%}$
 $C_{\%_2}$ $m_{r_2} = C_{\%_1} - C_{\%}$

```
\userikzlibrary {cd, ext.shapes.uncenteredrectangle}
\tikzcdset{/tikz-ext/tikz-cd fix}
\newcommand*\C[1]{C_{\%_{#1}}}
\begin{tikzcd}[
\sep=tiny,
\arrows={-, gray},
\cells={font=\strut, inner xsep=.2ex, inner ysep=.1ex},
\install uncentered rectangle in column=3
]
\C{1} \drar & & \uncrec{\m_{r_1}}{{\}}{{\}} = \C{2}-C_{\%} \dlar\\
& C_\% \\
\C{2} \urar & & \uncrec{\m_{r_2}}{{\}}{{\}} = \C{1}-C_\%} \ular\\
\end{tikzcd}
```

$$S \supset U_{\tau} \xrightarrow{\varphi_{0}} U_{\pi} \subset T$$

$$\downarrow^{\tau} \qquad \downarrow^{\pi}$$

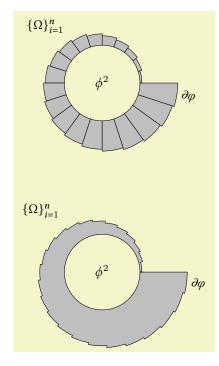

$$\text{Bl}_{(0,0)}(\mathbb{A}^{2}) \supset V_{\tau} \xrightarrow{\epsilon} V_{\pi} \subset \mathbb{A}^{2}$$

```
\usetikzlibrary {cd, ext.shapes.uncenteredrectangle}
\tikzset{/tikz-ext/tikz-cd fix}
\begin{tikzcd}[install uncentered rectangle in column/.list={1,2}]
\uncrec{S \supset {}}{U_\tau}{} \arrow[r, "\varphi_0"]
\uncrec{\U_\pi}{{} \subset T} \arrow[d, "\tau", "\sim"']
\uncrec{\operatorname{Bl}_{(0,0)}(\mathbb{A}^2) \supset{}}{V_\tau}{} \arrow[r, "\epsilon"]
& \uncrec{\V_\pi}{{} \subset \mathbb{A}^2} \subset \mathbb{A}^2}
\end{tikzcd}
```

 $^{^{7}}$ Due to a bug with /tikz/execute at end node, the "automatic" math mode in matrices can't be used with multipart nodes.

Part IV

Utilities

```
\usetikzlibrary {ext.misc}
\begin{tikzpicture}[
 declare function=\{bigR(\n) = smallR + .05*\n;\},
  declare constant={smallR=1; segments=20;},
  full arc=segments]
\foreach \iN[evaluate={\endRadius=bigR(\iN+1);}, use int=0 to segments-1]
 \filldraw[fill=gray!50] (\iN R:\endRadius)
   arc [radius=\endRadius, start angle=\iN R, delta angle=+1R] -- (\iN R+1R:smallR)
    arc [radius=smallR,
                              end angle=\iN R, delta angle=-1R] -- cycle;
\node
                                                    {$\phi^2$};
\node at (north west:\{ \text{sqrt 2 * bigR(segments/2)} \}  {\\0mega\\_{i=1}^n$};
\node[rotate=-.5R, right] at (-.5R: bigR segments) {$\partial \varphi$};
\tikzset{yshift=-5cm, declare constant={segments=25;}, full arc=segments}
\filldraw[fill=gray!50] (right:smallR)
 \foreach \iN[evaluate={\endRadius=bigR(\iN+1);}, use int=0 to segments-1] {
   -- (\iN R:\endRadius) arc[radius=\endRadius, start angle=\iN R, delta angle=1R]}
                                                                     delta angle=-360];
   -- (right:smallR)
                          arc[radius=smallR,
                                                 start angle=0,
\node
                                                    {$\phi^2$};
\node at (north west:\{ \text{sgrt 2 * bigR(segments/2)} \}  {\\0mega\\ {i=1}^n$\};
\node[rotate=-.5R, right] at (-.5R: bigR segments) {$\partial \varphi$};
\end{tikzpicture}
```

28 Calendar: Weeknumbers and more conditionals

```
\usepackage{pgfcalendar-ext} % LTEX
\input pgfcalendar-ext.tex % plain TEX
```

This package adds week numbers and more conditionals to the PGF package pqfcalendar.

```
Q & A: [11, 12, 16] & [28, 49, 35]
```

28.1 Extensions

The following tests are added.

- Jan This test is passed by all dates that are in the month of January.
- Feb as above.
- Mar as above.
- Apr as above.
- May as above.
- Jun as above.
- Jul as above.
- Aug as above.
- Sep as above.
- Oct as above.
- Nov as above.
- Dec as above.
- leap year=\(\frac{year}\) This test checks whether the given year is a leap year. If \(\frac{year}\) is omitted, it checks the year of the current date.
- and= $\{\langle tests \rangle\}$ This test passes when all $\langle tests \rangle$ pass.
- not= $\{\langle tests \rangle\}$ This test passes when $\langle tests \rangle$ do not pass.
- week of month= $\langle num \rangle$ This test passes when the date is in $\langle num \rangle$ th week of the month. The first week of the month start at day 1 and ends with day 7.

- week of month'= $\langle num \rangle$ As above but counts from the last day of the month. For a month with 31 days, this means the "1st" week starts at day 25 and ends with day 31.
- calendar week of month= $\langle num \rangle$ This test passes when the date is in $\langle num \rangle$ th calendar week of the month. The first week starts at the first day of the month and ends at the next Sunday.
- calendar week of month'=(num) As above but counts from the last day of the month.

```
1 2
3 4 5 6 7 8 9
10 11 12 13 14 15 16
17 18 19 20 21 22 23
24 25 26 27 28 29 30
31
```

- yesterday= $\{\langle tests \rangle\}$ This test passes when the previous day passes $\langle tests \rangle$.
- week= $\langle num \rangle$ This test passes when the current week of the year equals $\{\langle num \rangle\}$.

The shorthands for d- and m- are slightly changed so that they are expandable. This makes it possible to use these shorthands inside of PGFmath. The shorthands for the week (see section 28.2) are added. These are

- n- (shortest numerical representation),
- n= (shortest but added horizontal space) and
- n0 (leading zero when below 10).

28.2 Week numbering (ISO 8601)

 $\protect\pro$

This command calculates the week for the $\langle Julian\ day \rangle$ of $\langle year \rangle$. The $\langle week\ counter \rangle$ must be a TeX count.

The calculation follows the rule of ISO 8601 where the first week has that year's first Thursday in it.

Inside of \pgfcalendar the command \pgfcalendarcurrentweek will be available.

\pgfcalendarcurrentweek

This command returns the current week number (always two digits – use shorthand n. to strip the leading zero).

Inside of \ifdate the command \pgfcalendarifdateweek will be available.

\pgfcalendarifdateweek

This command returns the week number (always two digits).

29 Repeating Things and Other Things

```
\usepackage{pgffor-ext} % LATEX
\input pgffor-ext.tex % plain TEX
```

This package adds small niceties to the pgffor package. Most of these additions are also available with the ext.misc library.

Warning: Consider this package experimental. At the very least, it will break the . . . notation and possibly gobbles spaces after the body.

```
Q & A: [2, 8, 56] & [38, 44, 40]
```

Instead of \foreach \var in {start, start + delta, ..., end} one can use \foreach \var[use int=start to end step delta].

```
/pqf/foreach/use int=\langle start \rangle to \langle end \rangle step \langle delta \rangle
```

(no default)

The values $\langle start \rangle$, $\langle end \rangle$ and $\langle delta \rangle$ are evaluates by permath at initialization. The part step $\langle delta \rangle$ is optional ($\langle delta \rangle = 1$).

```
/pgf/foreach/use\ float=\langle start \rangle to \langle end \rangle step \langle delta \rangle
```

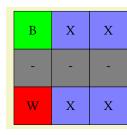

(no default)

Same as above, however the results are not truncated.

/pgf/foreach/no separator

(no value)

This key disables any separator between elements of the list. Every token is its own element. This also means that Unicode characters need to be grouped between { and } if LuaTeX isn't used. Spaces will be ignored.

```
\usetikzlibrary {ext.misc}
\newcommand*{\board}[3][]{%
 \begin{tikzpicture}[#1]
    \foreach[
      count=\i from 0,
     no separator,
      evaluate=\i as \colX using \{mod(\i, #2)\},
     evaluate=\i as \rowY using {int(\i/#2)}
    ] \elem in {#3} {
        \draw[black, board/\elem/.try, rectangle timer/.try=line]
          (\colX,\rowY) rectangle node {\elem} ++(1, 1);}
 \end{tikzpicture}}
\board[
 board/W/.style={fill=red},
 board/X/.style={fill=blue!50},
 board/B/.style={fill=green},
 board/-/.style={fill=gray},
]{3}{WXX---BXX}
```

/pgf/foreach/normal list

(no value)

This key simply disables all other special parsers and returns to the original list parser.

The following keys only work with LTEX and cannot be used when only the ext.misc library or the plainTEX pgffor-ext.tex are loaded. For this, you will need to use \usepackage{pgffor-ext}.

/pgf/foreach/xparser={\language argument specification\range} {\langla foreach value \range}

(no default)

This key can be used to specify a xparse specification for each element in the list.

For this to work somewhat seamless, the following needs to observed:

- Every {\(\langle argument specification \rangle \)} get appended u,. This means there's always one additional mandatory argument at the end of every element.
- The $\{\langle foreach\ value \rangle\}$ needs to correspond to the /pgf/foreach/var value.

/pgf/foreach/xparser 0m

(no value)

Sets up a list whose elements may contain an optional argument inside [] which correspond to two \foreach variables, say \Options/\Text.

Key handler $\langle key \rangle$ / .list xparse={ $\langle argument specification \rangle$ }{ $\langle comma-separated list of values \rangle$ }

This handler causes the key to be used repeatedly, namely once for every element of the list of values. The *(comma-separated list of values)* is processed using *(foreach and the given xparse (argument specification))* with the aforementioned xparser key.

30 And a little bit more

TikZ Library ext.misc

```
\label{thm:continuity} $$ \arrowvert $$ \a
```

This library adds miscellaneous utilities to PGFmath, PGF or TikZ.

```
Q & A: [24] & [27]
```

30.1 PGFmath

30.1.1 Postfix operator R

Similar to \segments[<num>] in PSTricks, the postfix operator R allows the user to use an arbitrary number of segments of a circle to be used instead of an angle.

```
/pgf/full arc=\langle num \rangle (default {})
```

The number $\langle num \rangle$ of segments will be set up. Using full arc with an empty value disables the segmentation and 1R equals 1° .

The given value $\langle num \rangle$ is evaluated when the key is used and doesn't change when $\langle num \rangle$ contains variables that change.

The R operator can then be used.

xR (postfix operator; uses the fullarc function) Multiplies x with $\frac{360}{\langle num \rangle}$.

30.1.2 Functions

```
strrepeat("Text", x)
\pgfmathstrrepeat{"Text"}{x}
```

Returns a string with *Text* repeated *x* times.

```
foofoofoofoo
    \pgfmathparse{strrepeat("foo", 5)}
    \pgfmathresult
```

```
isInString("String", "Text")
\pgfmathisInString{"String"}{"Text"}
    Returns 1 (true) if Text contains String, otherwise 0 (false).
                       \pgfmathparse{isInString("foo", "bar")}
            0 and 1
                       \pgfmathresult \ and\
                       \pgfmathparse{isInString("foo", "foobar")}
                       \pgfmathresult
strcat("Text A", "Text B", ...)
\pgfmathstrcat{" Text A"}{" Text B"}{...}
     Returns the concatenation of all given parameters.
                       \pgfmathparse{strcat("blue!", int(7*3), "!green")}
      blue!21!green
                       \pqfmathresult
isEmpty("Text")
\pgfmathisEmpty{"Text"}
     Returns 1 (true) if Text is empty, otherwise 0 (false).
                       \pgfmathparse{isEmpty("foo")} \pgfmathresult\ and\
      0 and 1 and 1
                       \pgfmathparse{isEmpty("")} \pgfmathresult\ and\
```

\pgfmathparse{isEmpty("\emptyText")} \pgfmathresult

\def\emptyText{}

atanXY(x,y)

$\protect\$ \pgfmathatanXY $\{x\}\{y\}$

Arctangent of $y \div x$ in degrees. This also takes into account the quadrant. This is just a argument-swapped version of atan2 which makes it easier to use the \p commands of the calc library.

```
53.13011 \pgfmathparse{atanXY(3,4)} \pgfmathresult
```

```
atanYX(y,x)
\pgfmathatanYX{y}{x}
```

Arctangent of $y \div x$ in degrees. This also takes into account the quadrant.

```
53.13011 \pgfmathparse{atanYX(4,3)} \pgfmathresult
```

30.1.3 Functions: using coordinates

The following functions can only be used with PGF and/or TikZ. Since the arguments are usually plain text (and not numbers) one has to wrap them in ".

```
\label{eq:condition} $$ anglebetween("p1", "p2") $$ pgfmathanglebetween{"p1"}{"p2"}
```

Return the angle between the centers of the nodes *p1* and *p2*.

```
qanglebetween("p")
\pgfmathqanglebetween{"p"}
```

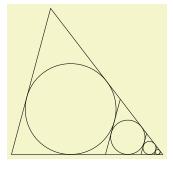

Return the angle between the origin and the center of the node p.

```
distancebetween("p1", "p2") \pgfmathdistancebetween("p1"){"p2"}
```

Return the distance (in pt) between the centers of the nodes *p1* and *p2*.

```
qdistancebetween("p")
\pgfmathqdistancebetween{"p"}
```

Return the distance (in pt) between the origin and the center of the node *p*.

30.2 PGFfor

This library loads also most of the functions of the pgffor-ext of section 29 on page 72.

30.3 PGFkeys

pgfkeys Library ext.pgfkeys-plus

```
\usepgfkeyslibrary{ext.pgfkeys-plus} % LTEX and plain TEX \usepgfkeyslibrary[ext.pgfkeys-plus] % ConTEXt
```

This extends PGFkeys and adds helpful /utils keys as well as handlers. This library gets loaded by the ext.misc library.

30.3.1 Conditionals

```
/utils/if = {\langle cond \rangle} {\langle true \rangle} {\langle false \rangle}  (no default)
```

This key checks the conditional $\langle cond \rangle$ and applies the styles $\langle true \rangle$ if $\langle cond \rangle$ is true, otherwise $\langle false \rangle$. $\langle cond \rangle$ can be anything that PGFmath understands.

As a side effect on how PGFkeys parses argument, the $\langle \mathit{false} \rangle$ argument is actually optional.

The following keys use $T_E\!X$ ' macros \if, \ifx, \ifnum and \ifdim for faster executions.

```
/utils/TeX/if=\langle token A \rangle \langle token B \rangle \{ \langle true \rangle \} \{ \langle false \rangle \} (no default)
```

This key checks via \if if $\langle token A \rangle$ matches $\langle token B \rangle$ and applies the styles $\langle true \rangle$ if it does, otherwise $\langle false \rangle$.

As a side effect on how PGFkeys parses argument, the $\langle \mathit{false} \rangle$ argument is actually optional.

```
/utils/TeX/ifx = \langle token A \rangle \langle token B \rangle \{ \langle true \rangle \} \{ \langle false \rangle \}  (no default)
```

As above but via \ifx.

```
/utils/TeX/ifnum=\{\langle num\ cond \rangle\}\{\langle true \rangle\}\{\langle false \rangle\}  (no default)
```

This key checks \ifnum $\langle num \, cond \rangle$ and applies the styles $\langle true \rangle$ if true, otherwise $\langle false \rangle$. A delimiting \relax will be inserted after $\langle num \, cond \rangle$.

As a side effect on how PGFkeys parses arguments, the $\langle \mathit{false} \rangle$ argument is actually optional.

```
/utils/TeX/ifdim=\langle dim \ cond \rangle \langle true \rangle \langle false \rangle (no default)
```

As above but with \ifdim.

```
/utils/TeX/ifempty=\langle Text \rangle \langle true \rangle \langle false \rangle (no default)
```

This checks whether $\langle Text \rangle$ is empty and applies styles $\langle true \rangle$ if true, otherwise $\langle false \rangle$.

```
/utils/TeX/ifxempty=\langle Text \rangle \langle true \rangle \langle false \rangle (no default)
```

This checks whether fully expanded $\langle Text \rangle$ is empty and applies styles $\langle true \rangle$ if true, otherwise $\langle false \rangle$.

30.3.2 Handlers

While already a lot of values given to keys are evaluated by PGFmath at some point, not all of them are.

```
Key handler \langle key \rangle / .pgfmath=\langle eval \rangle
```

This handler evaluates $\langle eval \rangle$ before it is handed to the key.

This handler works almost the same as the .evaluated handler but it does its evaluation in a group so that the result will not overwrite any other results.

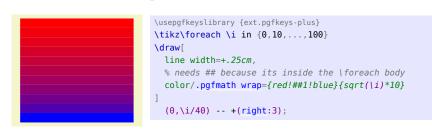

```
Key handler \langle key \rangle/.pgfmath int=\langle eval \rangle
```

As above but truncates the result.

```
Key handler \langle key \rangle/.pgfmath wrap={\langle wrapper \rangle}{\langle eval \rangle}
```

This feeds the result of $\langle eval \rangle$ as #1 to $\langle wrapper \rangle$.

In the example below, one could have used the <code>/pgf/foreach/evaluate key</code> from the <code>\foreach loop</code>.

Key handler $\langle key \rangle$ /.pgfmath if= $\{\langle cond \rangle\}\{\langle true \rangle\}\{\langle false \rangle\}$

Evaluates $\langle cond \rangle$ with pgfMath and returns $\langle true \rangle$ or $\langle false \rangle$ to the used key respectively.

Key handler $\langle key \rangle / .if = \langle token A \rangle \langle token B \rangle \{ \langle true \rangle \} \{ \langle false \rangle \}$

Checks via \if if $\langle token A \rangle$ matches $\langle token B \rangle$ and applies the value $\langle true \rangle$ if it does, otherwise $\langle false \rangle$.

Key handler $\langle key \rangle / .ifx = \langle token A \rangle \langle token B \rangle \{ \langle true \rangle \} \{ \langle false \rangle \}$

As above but via \ifx.

Key handler $\langle key \rangle / .ifnum = \{\langle ifnum cond \rangle\} \{\langle true \rangle\} \{\langle false \rangle\}$

Checks via \ifnum if $\langle ifnum \ cond \rangle$ and applies the value $\langle true \rangle$ if it does, otherwise $\langle false \rangle$.

As above but via \ifdim.

Key handler $\langle key \rangle / .ifxempty = {\langle Text \rangle} {\langle true \rangle} {\langle false \rangle}$

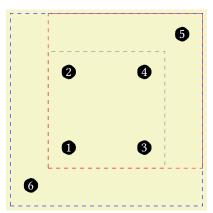

Checks whether a fully expanded $\langle \textit{Text} \rangle$ is empty and applies the value $\langle \textit{true} \rangle$ if it does, otherwise $\langle \textit{false} \rangle$.

Key handler $\langle key \rangle / .ifempty = {\langle Text \rangle} {\langle true \rangle} {\langle false \rangle}$

Checks whether $\langle \textit{Text} \rangle$ is empty and applies the value $\langle \textit{true} \rangle$ if it does, otherwise $\langle \textit{false} \rangle$.

Key handler $\langle key \rangle / . List = \{ \langle \langle e1 \rangle, \langle e2 \rangle, ..., \langle en \rangle \rangle \}$

This handler evaluates the given list with \foreach and concatenates the element and the result is then given to the used key.

```
\begin{tikzpicture} [nodes={draw, dashed, inner sep=+10pt}]
\foreach \point [count=\cnt] in {(0,0), (0,2), (2,0), (2,2), (3,3), (-1,-1)}
\node[circle, fill, inner sep=1pt, text=white] (point-\cnt) at \point {\cnt};
\node[gray, fit/.List={(point-1), (point-...), (point-4)}] {};
\node[red, fit/.List={(point-1), (point-...), (point-5)}] {};
\node[blue, fit/.List={(point-1), (point-...), (point-6)}] {};
\end{tikzpicture}
```

30.4 TikZ

/tikz/reverse clip=\langle direction\rangle

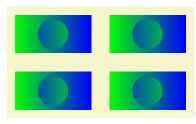

(default counter clockwise)

This key installs a very big rectangle which is either constructed counter clockwise (like the circle path operation) or clockwise.

/tikz/clip rule=(direction)

(default even odd)

This key switches directly⁸ to the specified rule which is either even odd or nonzero. This corresponds to the /tikz/even odd rule and /tikz/nonzero rule keys.

```
\newcommand*\myDiagram[1]{
  \fill[left color=blue, right color=green] (0, 0) rectangle (2, 1);
  \clip (1, .5) #1 [reverse clip];
  \fill[left color=green, right color=blue] (0, 0) rectangle (2, 1);
}
\begin{tikzpicture}[radius=.4, row sep=5mm, column sep=5mm]
\matrix[
  row 2/.append style={clip rule=even odd},
  column 1/.append style={reverse clip/.default=clockwise}
]{
  \myDiagram{circle[]} &
  \myDiagram{+(0:.4) arc[start angle=0, delta angle=-360] -- cycle}
\\
  \myDiagram{+(0:.4) arc[start angle=0, delta angle=-360] -- cycle}
\\};
\end{tikzpicture}
```

 $^{^8}$ Meaning, it directly executes \pgfseteorule /\pgfsetnonzerorule and doesn't accumulates where TikZ throws an error.

Part V

Changelog, Index & References

Changelog

Version 0.6 (2024-07-31)

- Added \tikzextset, \tikzextversion and \tikzextversionnumber
- Added six new auto placement mechanisms: ext/above, ext/below, ext/west, ext/east, ext/north and ext/south.
- Added ext/auto offset for auto placement.
- Added ext/precise auto angle.
- Added TikZ library ext.arrows-plus.
- Added TikZ library ext.topaths.autobend.
- Made ext.node-families and ext.scalepicture memoizable.

Version 0.5.1 (2023-04-02)

- Added PGF library ext.arrows.
- Bugfix to ext.pgfkeys-plus. [21]

Version 0.5 (2023-03-17)

- Added package pgffor-ext.
- Added TikZ library ext.nodes.
- Added TikZ library ext. layers.
- Bugfixes to ext.calendar-plus.
- Allow the original rectangle timer with ext.paths.timer.

Version 0.4.2 (2022-10-30)

- Added TikZ library ext.scalepicture.
- Bugfixes to shapes.uncenteredrectangle, paths.ortho, positioning-plus and pgfcalender-ext.

Version 0.4.1 (2022-10-23)

- Cleaned up directory structure of documentary.
- Added PGFkeys library ext.pgfkeys-plus.
- Added shape uncentered rectangle (PGF library ext.shapes.uncenteredrectangle).
- Fixed ext.paths.arcto again [20].

Version 0.4 (2022-10-10)

• CTAN version of 0.3.1

Version 0.3.1 (2022-10-09)

- Fixed ext.paths.ortho keys only vertical first and only horizontal first.
- Moved all (except the to paths) to namespace /tikz/ortho. /tikz/hvvh and /tikz/udlr are considered deprecated.
- Fixed \pgfcalendarjulianyeartoweek.
- · Added more calendar tests.
- Added directory structure.

Version 0.3 (2022-09-24)

 Added shape circle arrow (PGF library ext.shapes.circlearrow).

- Added shape circle cross split (PGF library ext.shapes.circlecrosssplit).
- Added shape heatmark (PGF library ext.shapes.heatmark).
- Added shape rectangle with rounded corners (PGF library ext.shapes.rectangleroundedcorners).
- Added shape superellipse (PGF library ext.shapes.superellipse).
- Added TikZ library ext.node-families.shapes.geometric.
- Fixed ext.node-families' key size.
- Renamed internal macros to use custom namespace starting with \tikzext@.
- Added some references.

Version 0.2 (2022-08-21)

• Added TikZ library ext.positioning-plus.

• Added TikZ library ext.node-families.

Version 0.1 (2022-08-16)

- Added TikZ library ext.calendar-plus.
- Added TikZ library ext.misc.
- Added TikZ library ext.paths.arcto.
- Added TikZ library ext.paths.ortho.
- Added TikZ library ext.paths.timer.
- Added TikZ library ext.patterns.images.
- Added TikZ library ext.topaths.arcthrough.
- Added TikZ library ext.transformations.mirror.
- Added PGF library ext.transformations.mirror.

Index

This index contains automatically generated entries as well as references to original functionalities of PGF/TikZ and references to functionalities outside of PGF/TikZ.
